In	dex	83		

**CHAPTER** 

ONE

## **BRIEF SUMMARY**

**scmdata** provides some useful data handling routines for dealing with data related to simple climate models (SCMs aka reduced complexity climate models, RCMs). In particular, it provides a high-performance way of handling and serialising (including to netCDF) timeseries data along with attached metadata. **scmdata** was inspired by pyam and was originally part of the opensom package.

## 1.1 License

scmdata is free software under a BSD 3-Clause License, see LICENSE.

## 1.1.1 Installation

scmdata is tested to work with Python 3.6 and above

## Installing with conda

The easiest way to install scmdata is using conda, either using the full Anaconda distribution which includes a collection of popular data science packages or the smaller Miniconda distribution. Using conda is the recommended method for installing scmdata for most users.

conda install -c conda-forge netcdf-scm

## Installing with pip

scmdata can also be installed from PyPi using pip.

We recommend creating a virtual environment to manage this and any other libraries your project requires.

pip install scmdata

## 1.1.2 Data Model

Analysing the results from simple climate models involves a lot of timeseries handling, including:

- filtering
- plotting
- · resampling
- · serialization/deserialisation
- · computation

As a result, **scmdata**'s approach to data handling focusses on efficient handling of timeseries.

## The ScmRun class

The <code>scmdata.ScmRun</code> class represents a collection of timeseries data including metadata and provides methods for manipulating the data. Internally, <code>ScmRun</code> stores the timeseries data in a single pandas.<code>DataFrame</code> and the timeseries metadata pandas.<code>MultiIndex</code> of type <code>pandas.Categorical</code>, for efficient indexing.

This class is the primary way of handling timeseries data within the **scmdata** package. For example, the *ScmRun* can be filtered to only find the subset of data which have a "scenario" metadata label equal to "green" (see *ScmRun*. *filter* for full details). Other operations include grouping, setting and (basic) plotting.

The complete set of manipulation features can be found in the documentation pages of ScmRun.

ScmRun has three key properties and one key method, which allow the user to quickly access their data in more standard formats:

- values returns all of the timeseries as a single numpy.ndarray without any metadata or indication of the time
  axis.
- meta returns all of the timeseries' metadata as a single pandas. DataFrame. This allows users to quickly have an overview of the timeseries held by scmdata. ScmRun without having to also view the data itself.
- metadata <scmdata.run.ScmRun.metadata stores run-specific metadata, i.e. metadata which isn't tied to
  any timeseries specifically.</li>
- timeseries() combines values and meta to form a pandas.DataFrame whose index is equal to scmdata. ScmRun.meta and whose values are equal to scmdata.ScmRun.values. The columns of the output of timeseries() are the time axis of the data.

## **Metadata handling**

**scmdata** can store any kind of metadata about the timeseries, without restriction. This combination allows it to be a high performing, yet flexible library for timeseries data.

However, to do this it must make assumptions about the type of data it holds and these assumptions come with tradeoffs. In particular, **scmdata** cannot hold metadata at a level finer than a complete timeseries. For example, it couldn't handle a case where one point in a timeseries needed to be labelled with an 'erroneous' label. In such a case the entire timeseries would have to be labelled 'erroneous' (or a new timeseries made with just that data point, which may not be very performant). If behaviour of this type is required, we suggest trying another data handling approach.

## The ScmDatabase class

When handling large datasets which may not fit into memory, it is important to be able to query subsets of the dataset without having to iterate over the entire dataset. <code>scmdata.database.ScmDatabase</code> helps with this issue by disaggregating a dataset into subsets according to unique combinations of metadata. The metadata of interest is specified by the user so that the database can be adapted to any use-case or access pattern.

One of the major benefits of *scmdata.database*. *ScmDatabase* is that the taxonomy of metadata does not need to be known at database creation making it easy to add new data to the database. Each unique subset of the database is stored as a single netCDF file. This ensures that if timeseries with new metadata are saved to the database, the existing files in the database do not need to be modified. Instead new files are written expanding the directory structure to accommodate the new metadata values.

Filtering using the metadata columns of interest is also very simple as the contents of a given file can be determined from the directory structure without having to load the file. Each file can then be loaded as the data is needed, minimising the need for reading data which will then immediately be filtered away of extra data that is needed to be unnecessarily read and then filtered away.

## 1.1.3 Development

If you're interested in contributing to SCMData, we'd love to have you on board! This section of the docs will (once we've written it) detail how to get setup to contribute and how best to communicate.

- Contributing
- Getting setup
  - Getting help
    - \* Development tools
    - \* Other tools
- Formatting
- Buiding the docs
  - Gotchas
  - Docstring style
- Releasing
  - First step
  - PyPI
  - Conda
  - Push to repository
- Why is there a Makefile in a pure Python repository?

## Contributing

All contributions are welcome, some possible suggestions include:

- tutorials (or support questions which, once solved, result in a new tutorial :D)
- blog posts
- improving the documentation
- · bug reports
- · feature requests
- pull requests

Please report issues or discuss feature requests in the SCMData issue tracker. If your issue is a feature request or a bug, please use the templates available, otherwise, simply open a normal issue:)

As a contributor, please follow a couple of conventions:

- Create issues in the SCMData issue tracker for changes and enhancements, this ensures that everyone in the community has a chance to comment
- Be welcoming to newcomers and encourage diverse new contributors from all backgrounds: see the Python Community Code of Conduct
- Only push to your own branches, this allows people to force push to their own branches as they need without fear
  or causing others headaches
- Start all pull requests as draft pull requests and only mark them as ready for review once they've been rebased onto master, this makes it much simpler for reviewers
- Try and make lots of small pull requests, this makes it easier for reviewers and faster for everyone as review time grows exponentially with the number of lines in a pull request

## **Getting setup**

To get setup as a developer, we recommend the following steps (if any of these tools are unfamiliar, please see the resources we recommend in *Development tools*):

- 1. Install conda and make
- 2. Run make virtual-environment, if that fails you can try doing it manually
  - 1. Change your current directory to SCMData's root directory (i.e. the one which contains README.rst), cd scmdata
  - 2. Create a virtual environment to use with SCMData python3 -m venv venv
  - 3. Activate your virtual environment source ./venv/bin/activate
  - 4. Upgrade pip pip intall --upgrade pip
  - 5. Install the development dependencies (very important, make sure your virtual environment is active before doing this) pip install -e .[dev]
- 3. Make sure the tests pass by running make test-all, if that fails the commands are
  - 1. Activate your virtual environment source ./venv/bin/activate
  - 2. Run the unit and integration tests pytest --cov -r a --cov-report term-missing

## **Getting help**

Whilst developing, unexpected things can go wrong (that's why it's called 'developing', if we knew what we were doing, it would already be 'developed'). Normally, the fastest way to solve an issue is to contact us via the issue tracker. The other option is to debug yourself. For this purpose, we provide a list of the tools we use during our development as starting points for your search to find what has gone wrong.

## **Development tools**

This list of development tools is what we rely on to develop SCMData reliably and reproducibly. It gives you a few starting points in case things do go inexplicably wrong and you want to work out why. We include links with each of these tools to starting points that we think are useful, in case you want to learn more.

- Git
- Make
- · Conda virtual environments
- Pip and pip virtual environments
- Tests
  - we use a blend of pytest and the inbuilt Python testing capabilities for our tests so checkout what we've already done in tests to get a feel for how it works
- Continuous integration (CI)
  - we use Travis CI for our CI but there are a number of good providers
- Jupyter Notebooks
  - Jupyter is automatically included in your virtual environment if you follow our Getting setup instructions
- Sphinx

## Other tools

We also use some other tools which aren't necessarily the most familiar. Here we provide a list of these along with useful resources.

- Regular expressions
  - we use regex101.com to help us write and check our regular expressions, make sure the language is set to Python to make your life easy!

## **Formatting**

To help us focus on what the code does, not how it looks, we use a couple of automatic formatting tools. These automatically format the code for us and tell use where the errors are. To use them, after setting yourself up (see *Getting setup*), simply run make format. Note that make format can only be run if you have committed all your work i.e. your working directory is 'clean'. This restriction is made to ensure that you don't format code without being able to undo it, just in case something goes wrong.

## **Buiding the docs**

After setting yourself up (see *Getting setup*), building the docs is as simple as running make docs (note, run make -B docs to force the docs to rebuild and ignore make when it says '... index.html is up to date'). This will build the docs for you. You can preview them by opening docs/build/html/index.html in a browser.

For documentation we use Sphinx. To get ourselves started with Sphinx, we started with this example then used Sphinx's getting started guide.

#### **Gotchas**

To get Sphinx to generate pdfs (rarely worth the hassle), you require Latexmk. On a Mac this can be installed with sudo tlmgr install latexmk. You will most likely also need to install some other packages (if you don't have the full distribution). You can check which package contains any missing files with tlmgr search --global --file [filename]. You can then install the packages with sudo tlmgr install [package].

## **Docstring style**

For our docstrings we use numpy style docstrings. For more information on these, here is the full guide and the quick reference we also use.

## Releasing

## First step

- 1. Test installation with dependencies make test-install
- 2. Update CHANGELOG.rst:
  - add a header for the new version between master and the latest bullet point
  - this should leave the section underneath the master header empty
- 3. git add .
- 4. git commit -m "release(vX.Y.Z)"
- 5. git tag vX.Y.Z
- 6. Test version updated as intended with make test-install

## **PyPI**

If uploading to PyPI, do the following (otherwise skip these steps)

- 1. make publish-on-testpypi
- 2. Go to test PyPI and check that the new release is as intended. If it isn't, stop and debug.
- 3. Test the install with make test-testpypi-install (this doesn't test all the imports as most required packages are not on test PyPI).

Assuming test PyPI worked, now upload to the main repository

- 1. make publish-on-pypi
- 2. Go to SCMData's PyPI and check that the new release is as intended.

3. Test the install with make test-pypi-install

## Conda

- 1. If you haven't already, fork the SCMData conda feedstock. In your fork, add the feedstock upstream with git remote add upstream https://github.com/conda-forge/scmdata-feedstock(upstream should now appear in the output of git remote -v)
- 2. Update your fork's master to the upstream master with:
  - 1. git checkout master
  - 2. git fetch upstream
  - 3. git reset --hard upstream/master
- 3. Create a new branch in the feedstock for the version you want to bump to.
- 4. Edit recipe/meta.yaml and update:
  - version number in line 2 (don't include the 'v' in the version tag)
  - the build number to zero in line 13 (you should only be here if releasing a new version)
  - update sha256 in line 10 (you can get the sha from SCMData's PyPI by clicking on 'Download files' on the left and then clicking on 'SHA256' of the .tar.gz file to copy it to the clipboard)
- 5. git add .
- 6. git commit -m "Update to vX.Y.Z"
- 7. git push
- 8. Make a PR into the SCMData conda feedstock
- 9. If the PR passes (give it at least 10 minutes to run all the CI), merge
- 10. Check https://anaconda.org/conda-forge/scmdata to double check that the version has increased (this can take a few minutes to update)

## **Push to repository**

Finally, push the tags and commit to the repository

- 1. git push
- 2. git push --tags

## Why is there a Makefile in a pure Python repository?

Whilst it may not be standard practice, a Makefile is a simple way to automate general setup (environment setup in particular). Hence we have one here which basically acts as a notes file for how to do all those little jobs which we often forget e.g. setting up environments, running tests (and making sure we're in the right environment), building docs, setting up auxillary bits and pieces.

## 1.1.4 scmdata.database

Database for handling large datasets in a performant, but flexible way

Data is chunked using unique combinations of metadata. This allows for the database to expand as new data is added without having to change any of the existing data.

Subsets of data are also able to be read without having to load all the data and then filter. For example, one could save model results from a number of different climate models and then load just the Surface Temperature data for all models.

```
class scmdata.database.DatabaseBackend(**kwargs)
     Bases: abc.ABC
     Abstract backend for serialising/deserialising data
     Data is stored as objects represented by keys. These keys can be used later to load data.
     delete(key)
           Delete a given key
               Parameters key (str) -
     abstract get(filters)
           Get all matching keys for a given filter
               Parameters filters (dict of str) - String filters If a level is missing then all values are
               Returns Each item is a key which may contain data which is of interest
               Return type list of str
     abstract load(key)
          Load data at a given key
               Parameters key (str) – Key to load
               Returns
               Return type scmdata.ScmRun
     abstract save(sr)
           Save data
               Parameters sr (scmdata.ScmRun) -
               Returns Key where the data is stored
               Return type str
class scmdata.database.NetCDFBackend(**kwargs)
     Bases: scmdata.database.DatabaseBackend
     On-disk database handler for outputs from SCMs
     Data is split into groups as specified by levels. This allows for fast reading and writing of new subsets of data
     when a single output file is no longer performant or data cannot all fit in memory.
     delete(key)
           Delete a key
               Parameters key (str) -
     get(filters)
           Get all matching objects for a given filter
```

Parameters filters (dict of str) - String filters If a level is missing then all values are fetched

#### Returns

Return type list of str

#### get\_key(sr)

Get key where the data will be stored

The key is the root directory joined with the other information provided. The filepath is also cleaned to remove spaces and special characters.

Parameters sr (scmdata.ScmRun) - Data to save

#### Raises

- ValueError If non-unique metadata is found for each of self.kwargs["levels"]
- **KeyError** If missing metadata is found for each of self.kwargs["levels"]

**Returns** Path in which to save the data without spaces or special characters

Return type str

load(key)

Parameters key (str) -

Returns

Return type scmdata.ScmRun

#### save(sr)

Save a ScmRun to the database

The dataset should not contain any duplicate metadata for the database levels

Parameters sr (scmdata.ScmRun) - Data to save

#### **Raises**

- ValueError If duplicate metadata are present for the requested database levels
- KeyError If metadata for the requested database levels are not found

**Returns** Key where the data is saved

Return type str

Bases: object

On-disk database handler for outputs from SCMs

Data is split into groups as specified by levels. This allows for fast reading and writing of new subsets of data when a single output file is no longer performant or data cannot all fit in memory.

#### available\_data()

Get all the data which is available to be loaded

If metadata includes non-alphanumeric characters then it might appear modified in the returned table. The original metadata values can still be used to filter data.

#### Returns

#### Return type pd.DataFrame

```
delete(**filters)
```

Delete data from the database

**Parameters filters** (*dict of str*) – Filters for the data to load.

Defaults to deleting all data if nothing is specified.

Raises ValueError – If a filter for a level not in levels is specified

load(disable\_tqdm=False, \*\*filters)

Load data from the database

#### **Parameters**

- disable\_tqdm (bool) If True, do not show the progress bar
- **filters** (dict of str : [str, list[str]]) Filters for the data to load.

Defaults to loading all values for a level if it isn't specified.

If a filter is a list then OR logic is applied within the level. For example, if we have scenario=["ssp119", "ssp126"] then both the ssp119 and ssp126 scenarios will be loaded.

Returns Loaded data

Return type scmdata.ScmRun

Raises ValueError – If a filter for a level not in levels is specified

If no data matching filters is found

## property root\_dir

Root directory of the database.

### Returns

Return type str

save(scmrun, disable\_tqdm=False)

Save data to the database

The results are saved with one file for each unique combination of levels in a directory structure underneath root dir.

Use available\_data() to see what data is available. Subsets of data can then be loaded as an scmdata. ScmRun using load().

#### **Parameters**

• scmrun (scmdata. ScmRun) – Data to save.

The timeseries in this run should have valid metadata for each of the columns specified in levels.

• disable\_tqdm (bool) - If True, do not show the progress bar

Raises KeyError – If a filter for a level not in levels is specified

scmdata.database.ensure\_dir\_exists(fp)

Ensure directory exists

**Parameters** fp(str) – Filepath of which to ensure the directory exists

## 1.1.5 scmdata.errors

Custom errors and exceptions used by scmdata

exception scmdata.errors.DuplicateTimesError(time\_index)

Bases: ValueError

Error raised when times are duplicated

exception scmdata.errors.MissingRequiredColumnError(columns)

Bases: ValueError

Error raised when an operation produces missing metadata columns

exception scmdata.errors.NonUniqueMetadataError(meta)

Bases: ValueError

Error raised when metadata is not unique

#### 1.1.6 scmdata.filters

Helpers for filtering data in scmdata.run.ScmRun.

Based upon pyam.utils.

scmdata.filters.datetime\_match( $data: List, dts: Union[List[datetime.datetime], datetime.datetime]) <math>\rightarrow$  numpy.ndarray

Match datetimes in time columns for data filtering.

#### **Parameters**

- data Input data to perform filtering on
- dts Datetimes to use for filtering

**Returns** Array where True indicates a match

Return type numpy.ndarray of bool

Raises TypeError – dts contains int

scmdata.filters.day\_match(data: List, days: Union[List[str], List[int], int, str])  $\rightarrow$  numpy.ndarray Match days in time columns for data filtering.

#### **Parameters**

- data Input data to perform filtering on
- days Days to match

**Returns** Array where True indicates a match

Return type numpy.ndarray of bool

scmdata.filters.find\_depth( $meta\_col: pandas.core.series.Series, s: str, level: Union[int, str], separator: str = '|') <math>\rightarrow$  numpy.ndarray

Find all values which match given depth from a filter keyword.

#### **Parameters**

- meta\_col Column in which to find values which match the given depth
- s Filter keyword, from which level should be applied

- **level** Depth of value to match as defined by the number of separator in the value name. If an int, the depth is matched exactly. If a str, then the depth can be matched as either "X-", for all levels up to level "X", or "X+", for all levels above level "X".
- **separator** The string used to separate levels in s. Defaults to a pipe ("|").

Returns Array where True indicates a match

Return type numpy.ndarray of bool

Raises ValueError – If level cannot be understood

scmdata.filters.hour\_match(data: List, hours: Union[List[int], int])  $\rightarrow$  numpy.ndarray Match hours in time columns for data filtering.

#### **Parameters**

- data Input data to perform filtering on
- hours Hours to match

**Returns** Array where True indicates a match

Return type numpy.ndarray of bool

 $scmdata.filters.is\_in(vals: List, items: List) \rightarrow numpy.ndarray$ 

Find elements of vals which are in items.

#### **Parameters**

- vals The list of values to check
- items The options used to determine whether each element of vals is in the desired subset or not

**Returns** Array of the same length as vals where the element is True if the corresponding element of vals is in items and False otherwise

Return type numpy.ndarray of bool

scmdata.filters.month\_match(data: List, months: Union[List[str], List[int], int, str])  $\rightarrow$  numpy.ndarray Match months in time columns for data filtering.

## **Parameters**

- data Input data to perform filtering on
- months Months to match

Returns Array where True indicates a match

**Return type** numpy.ndarray of bool

scmdata.filters.pattern\_match( $meta\_col: pandas.core.series.Series, values: Union[Iterable[str], str], level: Optional[Union[str, int]] = None, regexp: bool = False, separator: str = '|') <math>\rightarrow$  numpy.ndarray

Filter data by matching metadata columns to given patterns.

#### **Parameters**

- **meta\_col** Column to perform filtering on
- values Values to match
- **level** Passed to find\_depth(). For usage, see docstring of find\_depth().
- **regexp** If True, match using regexp rather than our pseudo regexp syntax.

- has\_nan If True, convert all nan values in meta\_col to empty string before applying filters. This means that "" and "\*" will match rows with numpy.nan. If False, the conversion is not applied and so a search in a string column which contains numpy.nan will result in a TypeError.
- **separator** String used to separate the hierarchy levels in values. Defaults to '|'

**Returns** Array where True indicates a match

**Return type** numpy.ndarray of bool

Raises TypeError - Filtering is performed on a string metadata column which contains numpy.nan and has\_nan is False

scmdata.filters.time\_match( $data: List, times: Union[List[str], List[int], int, str], conv_codes: List[str], strptime_attr: str, name: str) <math>\rightarrow$  numpy.ndarray

Match times by applying conversion codes to filtering list.

#### **Parameters**

- data Input data to perform filtering on
- **times** Times to match
- **conv\_codes** If times contains strings, conversion codes to try passing to time. strptime() to convert times to datetime.datetime
- **strptime\_attr** If times contains strings, the datetime.datetime attribute to finalize the conversion of strings to integers
- name Name of the part of a datetime to extract, used to produce useful error messages.

Returns Array where True indicates a match

Return type numpy.ndarray of bool

**Raises ValueError** – If input times cannot be converted understood or if input strings do not lead to increasing integers (i.e. "Nov-Feb" will not work, one must use ["Nov-Dec", "Jan-Feb"] instead)

scmdata.filters.years\_match(data: List, years: Union[List[int], numpy.ndarray, int])  $\rightarrow$  numpy.ndarray Match years in time columns for data filtering.

## **Parameters**

- data Input data to perform filtering on
- **years** Years to match

Returns Array where True indicates a match

**Return type** numpy.ndarray of bool

Raises TypeError – If years is not int or list of int

## 1.1.7 scmdata.groupby

Functionality for grouping and filtering ScmRun objects

class scmdata.groupby.RunGroupBy(run, groups)

Bases: scmdata.groupby.\_GroupBy

GroupBy object specialized to grouping ScmRun objects

**all**(dim=None, axis=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying all along some dimension(s).

#### **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply all.
- axis (int or sequence of int, optional) Axis(es) over which to apply all. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then all is calculated over axes.
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *all* on this object's data.

**Returns reduced** – New RunGroupBy object with *all* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

any(dim=None, axis=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying any along some dimension(s).

### **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply any.
- axis (int or sequence of int, optional) Axis(es) over which to apply any. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then any is calculated over axes.
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *any* on this object's data.

**Returns** reduced – New RunGroupBy object with *any* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

count(dim=None, axis=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying *count* along some dimension(s).

#### **Parameters**

• dim (str or sequence of str, optional) - Dimension(s) over which to apply count.

- axis (int or sequence of int, optional) Axis(es) over which to apply count. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then count is calculated over axes.
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *count* on this object's data.

**Returns reduced** – New RunGroupBy object with *count* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

```
map(func, *args, **kwargs)
```

Apply a function to each group and append the results

func is called like func(ar, \*args, \*\*kwargs) for each ScmRun ar in this group. If the result of this function call is None, than it is excluded from the results.

The results are appended together using run\_append(). The function can change the size of the input *ScmRun* as long as run\_append() can be applied to all results.

## **Examples**

#### **Parameters**

- **func** (function) Callable to apply to each timeseries.
- \*args Positional arguments passed to *func*.
- **\*\*kwargs** Used to call *func(ar, \*\*kwargs)* for each array *ar*.

**Returns** applied – The result of splitting, applying and combining this array.

Return type ScmRun

```
max(dim=None, axis=None, skipna=None, **kwargs)
```

Reduce this RunGroupBy's data by applying max along some dimension(s).

## **Parameters**

- **dim** (*str* or *sequence* of *str*, *optional*) Dimension(s) over which to apply *max*.
- axis (int or sequence of int, optional) Axis(es) over which to apply max. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then max is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).

- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *max* on this object's data.

**Returns reduced** – New RunGroupBy object with *max* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

**mean**(dim=None, axis=None, skipna=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying mean along some dimension(s).

#### **Parameters**

- dim (str or sequence of str, optional) Dimension(s) over which to apply mean.
- axis (int or sequence of int, optional) Axis(es) over which to apply mean. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then mean is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *mean* on this object's data.

**Returns reduced** – New RunGroupBy object with *mean* applied to its data and the indicated dimension(s) removed.

**Return type** *RunGroupBy* 

**median**(dim=None, axis=None, skipna=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying *median* along some dimension(s).

#### **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply median.
- axis (int or sequence of int, optional) Axis(es) over which to apply median. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then median is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *median* on this object's data.

**Returns** reduced – New RunGroupBy object with *median* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

**min**(dim=None, axis=None, skipna=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying *min* along some dimension(s).

#### **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply min.
- axis (int or sequence of int, optional) Axis(es) over which to apply min. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then min is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *min* on this object's data.

**Returns** reduced – New RunGroupBy object with *min* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

prod(dim=None, axis=None, skipna=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying *prod* along some dimension(s).

### **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply prod.
- axis (int or sequence of int, optional) Axis(es) over which to apply prod. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then prod is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).
- min\_count (int, default: None) The required number of valid values to perform the operation. If fewer than min\_count non-NA values are present the result will be NA. Only used if skipna is set to True or defaults to True for the array's dtype. New in version 0.10.8: Added with the default being None. Changed in version 0.17.0: if specified on an integer array and skipna=True, the result will be a float array.
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *prod* on this object's data.

**Returns reduced** – New RunGroupBy object with *prod* applied to its data and the indicated dimension(s) removed.

**Return type** *RunGroupBy* 

**reduce**(func, dim=None, axis=None, \*\*kwargs)

Reduce the items in this group by applying *func* along some dimension(s).

#### **Parameters**

- **func** (*function*) Function which can be called in the form *func*(*x*, *axis*=*axis*, \*\**kwargs*) to return the result of collapsing an np.ndarray over an integer valued axis.
- dim (..., str or sequence of str, optional) Not used in this implementation
- axis (int or sequence of int, optional) Axis(es) over which to apply func. Only one of the 'dimension' and 'axis' arguments can be supplied. If neither are supplied, then func is calculated over all dimension for each group item.
- \*\*kwargs (dict) Additional keyword arguments passed on to *func*.

**Returns** reduced – Array with summarized data and the indicated dimension(s) removed.

Return type ScmRun

**std**(dim=None, axis=None, skipna=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying *std* along some dimension(s).

#### **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply std.
- axis(int or sequence of int, optional)—Axis(es) over which to apply std. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then std is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *std* on this object's data.

**Returns reduced** – New RunGroupBy object with *std* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

sum(dim=None, axis=None, skipna=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying *sum* along some dimension(s).

## **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply sum.
- axis (int or sequence of int, optional) Axis(es) over which to apply sum. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then sum is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).
- min\_count (int, default: None) The required number of valid values to perform the operation. If fewer than min\_count non-NA values are present the result will be NA. Only used if skipna is set to True or defaults to True for the array's dtype. New in version

0.10.8: Added with the default being None. Changed in version 0.17.0: if specified on an integer array and skipna=True, the result will be a float array.

- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *sum* on this object's data.

**Returns** reduced – New RunGroupBy object with *sum* applied to its data and the indicated dimension(s) removed.

Return type RunGroupBy

var(dim=None, axis=None, skipna=None, \*\*kwargs)

Reduce this RunGroupBy's data by applying var along some dimension(s).

#### **Parameters**

- dim(str or sequence of str, optional) Dimension(s) over which to apply var.
- axis (int or sequence of int, optional) Axis(es) over which to apply var. Only one of the 'dim' and 'axis' arguments can be supplied. If neither are supplied, then var is calculated over axes.
- **skipna** (*bool*, *optional*) If True, skip missing values (as marked by NaN). By default, only skips missing values for float dtypes; other dtypes either do not have a sentinel missing value (int) or skipna=True has not been implemented (object, datetime64 or timedelta64).
- **keep\_attrs** (*bool*, *optional*) If True, the attributes (*attrs*) will be copied from the original object to the new one. If False (default), the new object will be returned without attributes.
- \*\*kwargs (dict) Additional keyword arguments passed on to the appropriate array function for calculating *var* on this object's data.

**Returns** reduced – New RunGroupBy object with *var* applied to its data and the indicated dimension(s) removed.

**Return type** *RunGroupBy* 

## 1.1.8 scmdata.netcdf

NetCDF4 file operations

Reading and writing ScmRun to disk as binary

 ${\tt scmdata.netcdf.inject\_nc\_methods}({\it cls})$ 

Add the to/from nc methods to a class

Parameters cls - Class to add methods to

 ${\tt scmdata.netcdf.nc\_to\_run(\it cls,fname)}$ 

Read a netCDF4 file from disk

Parameters fname (str) – Filename to read

See also:

scmdata.run.ScmRun.from\_nc()

```
scmdata.netcdf.run_to_nc(run, fname, dimensions=('region',), extras=(), **kwargs)
Write timeseries to disk as a netCDF4 file
```

Each unique variable will be written as a variable within the netCDF file. Choosing the dimensions and extras such that there are as few empty (or nan) values as possible will lead to the best compression on disk.

## **Parameters**

- **fname** (str) Path to write the file into
- **dimensions** (*iterable of str*) Dimensions to include in the netCDF file. The time dimension is always included (if not provided it will be the last dimension). An additional dimension (specifically a co-ordinate in xarray terms), "\_id", will be included if extras is provided and any of the metadata in extras is not uniquely defined by dimensions. "\_id" maps the timeseries in each variable to their relevant metadata.
- extras (iterable of str) Metadata columns to write as variables in the netCDF file (specifically as "non-dimension co-ordinates" in xarray terms, see xarray terminology for more details). Where possible, these non-dimension co-ordinates will use dimension co-ordinates as their own co-ordinates. However, if the metadata in extras is not defined by a single dimension in dimensions, then the extras co-ordinates will have dimensions of "\_id". This "\_id" co-ordinate maps the values in the extras co-ordinates to each timeseries in the serialised dataset. Where "\_id" is required, an extra "\_id" dimension will also be added to dimensions.
- **kwargs** Passed through to xarray.Dataset.to\_netcdf()

#### See also:

```
scmdata.run.ScmRun.to nc()
```

## 1.1.9 scmdata.offsets

Allow stepping through time using xarray's offset functionality

Provides similar functionality to https://pandas.pydata.org/pandas-docs/stable/user\_gui de/timeseries.html#dateoffset-objects

Generate a range of datetime objects between start and end, using offset to determine the steps.

The range will extend both ends of the span to the next valid timestep, see examples.

#### **Parameters**

- **start** (cftime.datetime) Starting datetime from which to generate the range (noting roll backward mentioned above and illustrated in the examples).
- **end** (cftime.datetime) Last datetime from which to generate the range (noting roll forward mentioned above and illustrated in the examples).
- **offset** Offset object for determining the timesteps.
- date\_cls (cftime.datetime) The time points will be returned as instances of date\_cls

Yields cftime.datetime - Next datetime in the range (the exact class is specified by date\_cls)

**Raises ValueError** – Offset does not result in increasing cftime.datetime's

## **Examples**

The range is extended at either end to the nearest timestep. In the example below, the first timestep is rolled back to 1st Jan 2001 whilst the last is extended to 1st Jan 2006.

```
>>> pprint([d for d in g])
[cftime.DatetimeGregorian(2001, 1, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2002, 1, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2003, 1, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2004, 1, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2005, 1, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2006, 1, 1, 0, 0, 0, 0)]
```

In this example the first timestep is rolled back to 31st Dec 2000 whilst the last is extended to 31st Dec 2005.

In this example the first timestep is already on the offset so stays there, the last timestep is to 1st Sep 2005.

```
>>> g = generate_range(
...     dt.datetime(2001, 4, 1),
...     dt.datetime(2005, 6, 3),
...     to_offset("QS"),
...)
>>> pprint([d for d in g])
[cftime.DatetimeGregorian(2001, 4, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2001, 7, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2001, 10, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2002, 1, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2002, 4, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2002, 7, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2002, 10, 1, 0, 0, 0, 0),
    cftime.DatetimeGregorian(2002, 10, 1, 0, 0, 0, 0),
```

(continues on next page)

```
cftime.DatetimeGregorian(2003, 4, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2003, 7, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2003, 10, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2004, 1, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2004, 4, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2004, 7, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2004, 10, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2005, 1, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2005, 4, 1, 0, 0, 0, 0),
cftime.DatetimeGregorian(2005, 7, 1, 0, 0, 0, 0)]
```

## 1.1.10 scmdata.ops

Operations for ScmRun objects

These largely rely on Pint's Pandas interface to handle unit conversions automatically

```
scmdata.ops.add(self, other, op_cols, **kwargs)
Add values
```

#### **Parameters**

- other (ScmRun) ScmRun containing data to add
- op\_cols(dict of str: str) Dictionary containing the columns to drop before adding as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the addition will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Sum of self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

## **Examples**

```
>>> import numpy as np
>>> from scmdata import ScmRun
>>>
\rightarrow > IDX = [2010, 2020, 2030]
>>>
>>>
>>> start = ScmRun(
         data=np.arange(18).reshape(3, 6),
         index=IDX.
         columns={
. . .
              "variable": [
                  "Emissions | CO2 | Fossil",
. . .
                  "Emissions | CO2 | AFOLU",
                  "Emissions | CO2 | Fossil",
```

(continues on next page)

```
"Emissions | CO2 | AFOLU",
                "Cumulative Emissions | CO2",
. . .
               "Surface Air Temperature Change",
            "unit": ["GtC / yr", "GtC / yr", "GtC / yr", "GtC / yr", "GtC", "K"],
            "region": ["World|NH", "World|NH", "World|SH", "World|SH", "World",

¬"World"],
            "model": "idealised",
            "scenario": "idealised".
. . .
       },
...)
>>>
>>> start.head()
                                                                2010-01-01 00:00:00

```

Adjust the median of (an ensemble of) timeseries to a specified target

#### **Parameters**

- target (float) Value to which the median of each (group of) timeseries should be adjusted
- **evaluation\_period** (*list[int]*) Period over which the median should be evaluated
- **process\_over** (*list*) Metadata to treat as 'ensemble members' i.e. all other columns in the metadata of self will be used to group the timeseries before calculating the median. If not supplied, timeseries will not be grouped.
- **check\_groups\_identical** (*bool*) Should we check that the median of each group is the same before making the adjustment?
- **check\_groups\_identical\_kwargs** (*dict*) Only used if **check\_groups\_identical** is True, in which case these are passed through to *np.testing.assert allclose*

#### Raises

- NotImplementedError evaluation\_period is based on times not years
- **AssertionError** If check\_groups\_identical is True and the median of each group is not the same before making the adjustment.

**Returns** Timeseries adjusted to have the intended median

Return type ScmRun

```
scmdata.ops.delta_per_delta_time(self, out_var=None)
```

Calculate change in timeseries values for each timestep, divided by the size of the timestep

The output is placed on the middle of each timestep and is one timestep shorter than the input.

**Parameters out\_var** (*str*) – If provided, the variable column of the output is set equal to out\_var. Otherwise, the output variables are equal to the input variables, prefixed with "Delta".

**Returns** scmdata. ScmRun containing the changes in values of self, normalised by the change in time

Return type scmdata.ScmRun

**Warns UserWarning** – The data contains nans. If this happens, the output data will also contain nans.

```
scmdata.ops.divide(self, other, op_cols, **kwargs)
Divide values (self / other)
```

#### **Parameters**

- other (ScmRun) ScmRun containing data to divide
- **op\_cols** (*dict of str: str*) Dictionary containing the columns to drop before dividing as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the division will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Quotient of self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

### **Examples**

## scmdata.ops.inject\_ops\_methods(cls)

Inject the operation methods

Parameters cls - Target class

scmdata.ops.integrate(self, out\_var=None)

Integrate with respect to time

**Parameters out\_var** (*str*) – If provided, the variable column of the output is set equal to out\_var. Otherwise, the output variables are equal to the input variables, prefixed with "Cumulative".

Returns scmdata. ScmRun containing the integral of self with respect to time

Return type scmdata.ScmRun

**Warns** UserWarning – The data being integrated contains nans. If this happens, the output data will also contain nans.

## scmdata.ops.linear\_regression(self)

Calculate linear regression of each timeseries

**Note:** Times in seconds since 1970-01-01 are used as the x-axis for the regressions. Such values can be accessed with self.time\_points.values.astype("datetime64[s]").astype("int"). This decision does not matter for the gradients, but is important for the intercept values.

**Returns list of dict[str** – List of dictionaries. Each dictionary contains the metadata for the timeseries plus the gradient (with key "gradient") and intercept ( with key "intercept"). The gradient and intercept are stored as pint.Quantity.

**Return type** Any]

#### scmdata.ops.linear\_regression\_gradient(self, unit=None)

Calculate gradients of a linear regression of each timeseries

**Parameters unit** (*str*) – Output unit for gradients. If not supplied, the gradients' units will not be converted to a common unit.

**Returns** self.meta plus a column with the value of the gradient for each timeseries. The "unit" column is updated to show the unit of the gradient.

Return type pandas.DataFrame

## scmdata.ops.linear\_regression\_intercept(self, unit=None)

Calculate intercepts of a linear regression of each timeseries

**Note:** Times in seconds since 1970-01-01 are used as the x-axis for the regressions. Such values can be accessed with self.time\_points.values.astype("datetime64[s]").astype("int"). This decision does not matter for the gradients, but is important for the intercept values.

**Parameters unit** (*str*) – Output unit for gradients. If not supplied, the gradients' units will not be converted to a common unit.

**Returns** self.meta plus a column with the value of the gradient for each timeseries. The "unit" column is updated to show the unit of the gradient.

Return type pandas.DataFrame

```
scmdata.ops.linear_regression_scmrun(self)
```

Re-calculate the timeseries based on a linear regression

**Returns** The timeseries, re-calculated based on a linear regression

Return type scmdata.ScmRun

```
scmdata.ops.multiply(self, other, op_cols, **kwargs)
Multiply values
```

#### **Parameters**

- **other** (*ScmRun*) *ScmRun* containing data to multiply
- **op\_cols** (*dict of str: str*) Dictionary containing the columns to drop before multiplying as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the multiplication will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Product of self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

## **Examples**

```
>>> import numpy as np
>>> from scmdata import ScmRun
\rightarrow > IDX = [2010, 2020, 2030]
>>>
>>>
>>> start = ScmRun(
         data=np.arange(18).reshape(3, 6),
         index=IDX,
. . .
         columns={
             "variable": [
. . .
                  "Emissions | CO2 | Fossil",

```

scmdata.ops.prep\_for\_op(inp, op\_cols, meta, ur=<openscm\_units.\_unit\_registry.ScmUnitRegistry object>)

Prepare dataframe for operation

#### **Parameters**

- inp (ScmRun) ScmRun containing data to prepare
- **op\_cols** (*dict of str: str*) Dictionary containing the columns to drop in order to prepare for the operation as the keys (the values are not used). For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then we will drop the "variable" column from the index.
- ur (pint.UnitRegistry) Pint unit registry to use for the operation

## Returns

Timeseries to use for the operation. They are the transpose of the normal ScmRun. timeseries() output with the columns being Pint arrays (unless "unit" is in op\_cols in which case no units are available to be used so the columns are standard numpy arrays). We do this so that we can use Pint's Pandas interface to handle unit conversions automatically.

Return type pandas.DataFrame

scmdata.ops.set\_op\_values(output, op\_cols)

Set operation values in output

#### **Parameters**

- output (pandas.Dataframe) Dataframe of which to update the values
- op\_cols (dict of str: str) Dictionary containing the columns to update as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".

**Returns** output with the relevant columns being set according to op\_cols.

Return type pandas. Dataframe

scmdata.ops.subtract(self, other, op\_cols, \*\*kwargs)

Subtract values

## **Parameters**

- other (ScmRun) ScmRun containing data to subtract
- op\_cols (dict of str: str) Dictionary containing the columns to drop before subtracting as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the subtraction will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Difference between self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

## **Examples**

```
>>> import numpy as np
>>> from scmdata import ScmRun
\rightarrow > IDX = [2010, 2020, 2030]
>>>
>>>
>>> start = ScmRun(
        data=np.arange(18).reshape(3, 6),
        index=IDX.
        columns={
            "variable": [
                 "Emissions | CO2 | Fossil",
                 "Emissions | CO2 | AFOLU",
                 "Emissions | CO2 | Fossil",
                "Emissions | CO2 | AFOLU".
                 "Cumulative Emissions | CO2",
                "Surface Air Temperature Change",
            "unit": ["GtC / yr", "GtC / yr", "GtC / yr", "GtC / yr", "GtC", "K"],

## 1.1.11 scmdata.plotting

Plotting helpers for ScmRun

See the example notebook 'plotting-with-seaborn.ipynb' for usage examples

```
scmdata.plotting.inject_plotting_methods(cls)
```

Inject the plotting methods

**Parameters** cls – Target class

```
scmdata.plotting.lineplot(self, time_axis=None, **kwargs)
```

Make a line plot via seaborn's lineplot

If only a single unit is present, it will be used as the y-axis label. The axis object is returned so this can be changed by the user if desired.

### **Parameters**

```
• time_axis ({None, "year", "year-month", "days since 1970-01-01", "seconds since 1970-01-01"} # noqa: E501) - Time axis to use for the plot.
```

If None, datetime.datetime objects will be used.

If "year", the year of each time point will be used.

If "year-month", the year plus (month - 0.5) / 12 will be used.

If "days since 1970-01-01", the number of days since 1st Jan 1970 will be used (calculated using the datetime module).

If "seconds since 1970-01-01", the number of seconds since 1st Jan 1970 will be used (calculated using the datetime module).

\*\*kwargs – Keyword arguments to be passed to seaborn.lineplot. If none are passed, sensible defaults will be used.

Returns Output of call to seaborn.lineplot

Return type matplotlib.axes.\_subplots.AxesSubplot

```
scmdata.plotting.plumeplot(self, ax=None, quantiles_plumes=[((0.05, 0.95), 0.5), ((0.5,), 1.0)], hue_var='scenario', hue_label='Scenario', palette=None, style_var='variable', style_label='Variable', dashes=None, linewidth=2, time_axis=None, pre_calculated=False, quantile_over=('ensemble_member',))
```

Make a plume plot, showing plumes for custom quantiles

## **Parameters**

- ax (matplotlib.axes.\_subplots.AxesSubplot) Axes on which to make the plot
- quantiles\_plumes (list[tuple[tuple, float]]) Configuration to use when plotting quantiles. Each element is a tuple, the first element of which is itself a tuple and the second element of which is the alpha to use for the quantile. If the first element has length two, these two elements are the quantiles to plot and a plume will be made between these two quantiles. If the first element has length one, then a line will be plotted to represent this quantile.
- **hue\_var** (*str*) The column of self.meta which should be used to distinguish different bues
- hue\_label (str) Label to use in the legend for hue\_var.
- palette (dict) Dictionary defining the colour to use for different values of hue\_var.
- **style\_var** (*str*) The column of self.meta which should be used to distinguish different styles.
- **style\_label** (*str*) Label to use in the legend for **style\_var**.
- dashes (dict) Dictionary defining the style to use for different values of style\_var.
- **linewidth** (*float*) Width of lines to use (for quantiles which are not to be shown as plumes)
- **time\_axis** (*str*) Time axis to use for the plot (see timeseries())
- **pre\_calculated** (bool) Are the quantiles pre-calculated? If no, the quantiles will be calculated within this function. Pre-calculating the quantiles using ScmRun. quantiles\_over() can lead to faster plotting if multiple plots are to be made with the same quantiles.
- quantile\_over (str, tuple[str]) Columns of self.meta over which the quantiles should be calculated. Only used if pre\_calculated is False.

**Returns** Axes on which the plot was made and the legend items we have made (in case the user wants to move the legend to a different position for example)

Return type matplotlib.axes.\_subplots.AxesSubplot, list

# **Examples**

Plot the plumes, calculated over the different ensemble members.

```
>>> scmrun.plumeplot(quantile_over="ensemble_member")
```

Pre-calculate the quantiles, then plot

```
>>> summary_stats = ScmRun(
... scmrun.quantiles_over("ensemble_member", quantiles=quantiles)
... )
>>> summary_stats.plumeplot(pre_calculated=True)
```

**Note:** scmdata is not a plotting library so this function is provided as is, with little testing. In some ways, it is more intended as inspiration for other users than as a robust plotting tool.

# 1.1.12 scmdata.processing

Miscellaneous functions for processing scmdata. ScmRun

These functions are intended to be able to be used directly with scmdata.ScmRun.process\_over().

scmdata.processing.calculate\_crossing\_times(scmrun, threshold, return\_year=True)

Calculate the time at which each timeseries crosses a given threshold

## **Parameters**

- scmrun (scmdata.ScmRun) Data to calculate the crossing time of
- **threshold** (*float*) Value to use as the threshold for crossing
- return\_year (bool) If True, return the year instead of the datetime

**Returns** Crossing time for scmrun, using the meta of scmrun as the output's index. If the threshold is not crossed, pd.NA is returned.

Return type pd. Series

# **Notes**

This function only returns times that are in the columns of scmrun. If you want a finer resolution then you should interpolate your data first. For example, if you have data on a ten-year timestep but want crossing times on an annual resolution, interpolate (or resample) to annual data before calling calculate\_crossing\_times.

```
scmdata.processing.calculate_crossing_times_quantiles(crossing_times, groupby, quantiles=(0.05, 0.5, 0.95), nan_fill_value=1000000, out_nan_threshold=100000, interpolation='linear')
```

Calculate quantiles of crossing times

This calculation is non-trivial because some timeseries may never cross a given threshold. As a result, some care is required to return sensible quantiles. In this function, the quantiles are calculated as follows:

- 1. all nan values in crossing\_times are filled with nan\_fill\_value
- 2. quantiles are calculated using pd.groupby.quantile
- 3. quantiles which never crossed are inferred by examining whether the output values are greater than out\_nan\_threshold. If the calculated value is greater than out\_nan\_threshold then nan is returned for this quantile.

## **Parameters**

- **crossing\_times** (pd.Series) Crossing times, can be calculated using *scmdata*. processing.calculate\_crossing\_times()
- **groupby** (list[str]) Columns to group the output by
- quantiles (float) Quantiles to calculate
- nan\_fill\_value (float) Value to use to fill in nan values before calculating the quantiles
- **out\_nan\_threshold** (*float*) Threshold to decide whether a calculated quantile should be nan or not
- **interpolation** (*str*) Interpolation to use when calculating the quantiles, see pandas. Series.quantile()

**Returns** Crossing time quantiles

Return type pd. Series

**Raises** NotImplementedError – crossing\_times contains datetime objects, please raise an issue if this is your use case.

# **Examples**

```
>>> crossing_times = pd.Series(

```

Calculate exceedance probability over all time

## **Parameters**

- scmrun (scmdata.ScmRun) Ensemble of which to calculate the exceedance probability
- **threshold** (*float*) Value to use as the threshold for exceedance
- **process\_over\_cols** (list[str]) Columns to not use when grouping the timeseries (typically "run\_id" or "ensemble\_member" or similar)
- **output\_name** (*str*) If supplied, the name of the output series. If not supplied, "{threshold} exceedance probability" will be used.

**Returns** Exceedance probability over all time over all members of each group in scmrun

Return type pd. Series

**Raises ValueError** – scmrun has more than one variable or more than one unit (convert to a single unit before calling this function if needed)

## **Notes**

See the notes of scmdata.processing.calculate\_exceedance\_probabilities\_over\_time() for an explanation of how the two calculations differ. For most purposes, this is the correct function to use.

```
{\tt scmdata.processing.calculate\_exceedance\_probabilities\_over\_time} (scmrun, threshold, process\_over\_cols, output\_name=None)
```

Calculate exceedance probability at each point in time

## **Parameters**

- scmrun (scmdata.ScmRun) Ensemble of which to calculate the exceedance probability over time
- **threshold** (*float*) Value to use as the threshold for exceedance
- **process\_over\_cols** (list[str]) Columns to not use when grouping the timeseries (typically "run\_id" or "ensemble\_member" or similar)
- output\_name (str) If supplied, the value to put in the "variable" columns of the output pd.DataFrame. If not supplied, "{threshold} exceedance probability" will be used.

Returns Timeseries of exceedance probability over time

Return type pd.DataFrame

**Raises ValueError** – scmrun has more than one variable or more than one unit (convert to a single unit before calling this function if needed)

## **Notes**

This differs from <code>scmdata.processing.calculate\_exceedance\_probabilities()</code> because it calculates the exceedance probability at each point in time. That is different from calculating the exceedance probability by first determining the number of ensemble members which cross the threshold <code>at any point in time</code> and then dividing by the number of ensemble members. In general, this function will produce a maximum exceedance probability which is equal to or less than the output of <code>scmdata.processing.calculate\_exceedance\_probabilities()</code>. In our opinion, <code>scmdata.processing.calculate\_exceedance\_probabilities()</code> is the correct function to use if you want to know the exceedance probability of a scenario. This function gives a sense of how the exceedance probability evolves over time but, as we said, will generally slightly underestimate the exceedance probability over all time.

scmdata.processing.calculate\_peak(scmrun, output\_name=None)

Calculate peak i.e. maximum of each timeseries

## **Parameters**

- scmrun (scmdata.ScmRun) Ensemble of which to calculate the exceedance probability over time
- **output\_name** (*str*) If supplied, the value to put in the "variable" columns of the output series. If not supplied, "Peak {variable}" will be used.

**Returns** Peak of each timeseries

Return type pd. Series

scmdata.processing.calculate\_peak\_time(scmrun, output\_name=None, return\_year=True)

Calculate peak time i.e. the time at which each timeseries reaches its maximum

## **Parameters**

- scmrun (scmdata.ScmRun) Ensemble of which to calculate the exceedance probability over time
- **output\_name** (*str*) If supplied, the value to put in the "variable" columns of the output series. If not supplied, "Peak {variable}" will be used.
- return\_year (bool) If True, return the year instead of the datetime

**Returns** Peak of each timeseries

Return type pd. Series

 $scmdata.processing. \textbf{calculate\_summary\_stats}(scmrun, index, exceedance\_probabilities\_thresholds = (1.5, 2.0, 2.5), exceedance\_probabilities\_variable = 'Surface Air Temperature Change', exceedance\_probabilities\_naming\_base = None, peak\_quantiles = (0.05, 0.17, 0.5, 0.83, 0.95), peak\_variable = 'Surface Air Temperature Change', peak\_naming\_base = None, peak\_time\_naming\_base = None, peak\_return\_year = True, categorisation\_variable = 'Surface Air Temperature Change', categorisation\_quantile\_cols = ('ensemble\_member',),$ 

Calculate common summary statistics

#### **Parameters**

- scmrun (scmdata.ScmRun) Data of which to calculate the stats
- index (list[str]) Columns to use in the index of the output (unit is added if not included)

progress=False)

- exceedance\_probabilities\_threshold (list[float]) Thresholds to use for exceedance probabilities
- **exceedance\_probabilities\_variable** (*str*) Variable to use for exceedance probability calculations
- exceedance\_probabilities\_naming\_base (str) String to use as the base for naming the exceedance probabilities. Each exceedance probability output column will have a name given by exceedance\_probabilities\_naming\_base.format(threshold) where threshold is the exceedance probability threshold to use. If not supplied, the default output of scmdata.processing.calculate\_exceedance\_probabilities() will be used.
- **peak\_quantiles** (list[float]) Quantiles to report in peak calculations
- **peak\_variable** (*str*) Variable of which to calculate the peak
- **peak\_naming\_base** (*str*) Base to use for naming the peak outputs. This is combined with the quantile. If not supplied, "{} peak" is used so the outputs will be named e.g. "0.05 peak", "0.5 peak", "0.95 peak".
- **peak\_time\_naming\_base** (*str*) Base to use for naming the peak time outputs. This is combined with the quantile. If not supplied, "{} peak year" is used (unless peak\_return\_year is False in which case "{} peak time" is used) so the outputs will be named e.g. "0.05 peak year", "0.5 peak year", "0.95 peak year".
- **peak\_return\_year** (*bool*) If True, return the year of the peak of **peak\_variable**, otherwise return full dates
- **categorisation\_variable** (*str*) Variable to use for categorisation. Note that this variable point to timeseries that contain global-mean surface air temperatures (GSAT) relative to 1850-1900 (using another reference period will not break this function, but is inconsistent with the original algorithm).
- categorisation\_quantile\_cols (list[str]) Columns which represent individual ensemble members in the output (e.g. ["ensemble\_member"]). The quantiles are taking over these columns before the data is passed to scmdata.processing.categorisation\_sr15().
- progress (bool) Should a progress bar be shown whilst the calculations are done?

**Returns** Summary statistics, with each column being a statistic and the index being given by index **Return type** pd.DataFrame

scmdata.processing.categorisation\_sr15(scmrun, index)

Categorise using the algorithm employed in SR1.5

For more information, see the SR1.5 scenario analysis notebook.

## **Parameters**

- **scmrun** Data to use for the classification. This should contain global-mean surface air temperatures (GSAT) relative to 1850-1900 (using another reference period will not break this function, but is inconsistent with the original algorithm). The data must have a "quantile" column and it must have the 0.33, 0.5 and 0.66 quantiles calculated. This can be done with scmdata.ScmRun.quantiles\_over().
- index (list[str]) Columns in scmrun.meta to use as the index of the output

**Returns** Categorisation of the timeseries

Return type class: pd.Series

Raises

- ValueError More than one variable or one unit is in scmrun
- **DimensionalityError** The units cannot be converted to kelvin

# 1.1.13 scmdata.run

Bases: scmdata.run.BaseScmRun

Data container for holding one or many time-series of SCM data.

```
__init__(data: Optional[Any] = None, index: Optional[Any] = None, columns: Optional[Union[Dict[str, list], Dict[str, str]]] = None, metadata: Optional[Dict[str, Union[str, int, float]]] = None, copy_data: bool = False, **kwargs: Any)

Initialize the container with timeseries data.
```

## ianze the container with times

## **Parameters**

• data(Union[ScmRun, IamDataFrame, pd.DataFrame, np.ndarray, str])—If a ScmRun object is provided, then a new ScmRun is created with a copy of the values and metadata from :obj: data.

A pandas.DataFrame with IAMC-format data columns (the result from *ScmRun.timeseries*()) can be provided without any additional columns and index information.

If a numpy array of timeseries data is provided, columns and index must also be specified. The shape of the numpy array should be (n\_times, n\_series) where n\_times is the number of timesteps and n\_series is the number of time series.

If a string is passed, data will be attempted to be read from file. Currently, reading from CSV, gzipped CSV and Excel formatted files is supported.

If no data is provided than an empty *ScmRun* object is created.

• **index** (*np.ndarray*) – If index is not None, then the index is used as the timesteps for run. All timeseries in the run use the same set of timesteps.

The values will be attempted to be converted to numpy.datetime[s] values. Possible input formats include:

- datetime.datetime
- int Start of year
- float Decimal year
- str Uses dateutil.parser(). Slow and should be avoided if possible

If index is None, than the time index will be obtained from the data if possible.

• **columns** – If None, ScmRun will attempt to infer the values from the source. Otherwise, use this dict to write the metadata for each timeseries in data. For each metadata key (e.g. "model", "scenario"), an array of values (one per time series) is expected. Alternatively, providing a list of length 1 applies the same value to all timeseries in data. For example, if you had three timeseries from 'rcp26' for 3 different models 'model', 'model2' and 'model3', the column dict would look like either 'col 1' or 'col 2':

```
>>> col_1 = {
    "scenario": ["rcp26"],
    "model": ["model1", "model2", "model3"],
    "region": ["unspecified"],
    "variable": ["unspecified"],
    "unit": ["unspecified"]
}
>>> col_2 = {
    "scenario": ["rcp26", "rcp26", "rcp26"],
    "model": ["model1", "model2", "model3"],
    "region": ["unspecified"],
    "variable": ["unspecified"],
    "unit": ["unspecified"]
}
>>> assert pd.testing.assert_frame_equal(
    ScmRun(d, columns=col_1).meta,
    ScmRun(d, columns=col_2).meta
)
```

• metadata – Optional dictionary of metadata for instance as a whole.

This can be used to store information such as the longer-form information about a particular dataset, for example, dataset description or DOIs.

Defaults to an empty dict if no default metadata are provided.

• **copy\_data** (*bool*) – If True, an explicit copy of data is performed.

**Note:** The copy can be very expensive on large timeseries and should only be needed in cases where the original data is manipulated.

• \*\*kwargs – Additional parameters passed to \_read\_file() to read files

# Raises

• ValueError -

- If you try to load from multiple files at once. If you wish to do this, please use scmdata.
   run.run\_append() instead. \* Not specifying index and columns if data is a numpy.
   ndarray
- scmdata.errors.MissingRequiredColumn If metadata for required\_cols is not found
- TypeError Timeseries cannot be read from data

```
add(other, op_cols, **kwargs)
Add values
```

## **Parameters**

- other (ScmRun) ScmRun containing data to add
- **op\_cols** (*dict of str: str*) Dictionary containing the columns to drop before adding as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the addition will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Sum of self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

# **Examples**

```
>>> import numpy as np
>>> from scmdata import ScmRun
>>>
>>> IDX = [2010, 2020, 2030]
>>>
>>>
>>> start = ScmRun(
         data=np.arange(18).reshape(3, 6),
. . .
         index=IDX,
. . .
         columns={
. . .
             "variable": [
                  "Emissions | CO2 | Fossil",
                  "Emissions | CO2 | AFOLU",
                  "Emissions | CO2 | Fossil",
. . .
                  "Emissions | CO2 | AFOLU",
                  "Cumulative Emissions | CO2".
. . .
                  "Surface Air Temperature Change",
             ],
. . .
             "unit": ["GtC / yr", "GtC / yr", "GtC / yr", "GtC / yr", "GtC", "K
. . .
''],

Adjust the median of (an ensemble of) timeseries to a specified target

# **Parameters**

- target (float) Value to which the median of each (group of) timeseries should be adjusted
- evaluation\_period (list[int]) Period over which the median should be evaluated
- **process\_over** (*list*) Metadata to treat as 'ensemble members' i.e. all other columns in the metadata of self will be used to group the timeseries before calculating the median. If not supplied, timeseries will not be grouped.
- **check\_groups\_identical** (*bool*) Should we check that the median of each group is the same before making the adjustment?
- **check\_groups\_identical\_kwargs** (*dict*) Only used if **check\_groups\_identical** is **True**, in which case these are passed through to *np.testing.assert\_allclose*

# Raises

- NotImplementedError evaluation\_period is based on times not years
- **AssertionError** If check\_groups\_identical is True and the median of each group is not the same before making the adjustment.

**Returns** Timeseries adjusted to have the intended median

## Return type ScmRun

For details, see run\_append().

#### **Parameters**

- other Data (in format which can be cast to ScmRun) to append
- **inplace** If True, append data in place and return None. Otherwise, return a new *ScmRun* instance with the appended data.
- duplicate\_msg If True, raise a *scmdata.errors.NonUniqueMetadataError* error so the user can see the duplicate timeseries. If False, take the average and do not raise a warning or error. If "warn", raise a warning if duplicate data is detected.
- metadata If not None, override the metadata of the resulting *ScmRun* with metadata. Otherwise, the metadata for the runs are merged. In the case where there are duplicate metadata keys, the values from the first run are used.
- \*\*kwargs Keywords to pass to ScmRun.\_\_init\_\_() when reading other

**Returns** If not inplace, return a new *ScmRun* instance containing the result of the append.

Return type ScmRun

**Raises** *NonUniqueMetadataError* – If the appending results in timeseries with duplicate metadata and duplicate\_msg is True

append\_timewise(other, align\_columns)

Append timeseries along the time axis

#### **Parameters**

- other (scmdata.ScmRun) scmdata.ScmRun containing the timeseries to append
- align\_columns (list) Columns used to align other and self when joining

**Returns** Result of joining self and other along the time axis

Return type scmdata.ScmRun

**convert\_unit**(*unit:* str, context: Optional[str] = None, inplace: bool = False, \*\*kwargs: Any) Convert the units of a selection of timeseries.

Uses scmdata.units.UnitConverter to perform the conversion.

# **Parameters**

- unit Unit to convert to. This must be recognised by UnitConverter.
- **context** Context to use for the conversion i.e. which metric to apply when performing CO2-equivalent calculations. If None, no metric will be applied and CO2-equivalent calculations will raise DimensionalityError.
- **inplace** If True, apply the conversion inplace and return None
- \*\*kwargs Extra arguments which are passed to filter() to limit the timeseries which are attempted to be converted. Defaults to selecting the entire ScmRun, which will likely fail.

**Returns** If inplace is not False, a new ScmRun instance with the converted units.

Return type ScmRun

## **Notes**

If context is not None, then the context used for the conversion will be checked against any existing metadata and, if the conversion is valid, stored in the output's metadata.

**Raises ValueError** — "unit\_context" is already included in self's meta\_attributes() and it does not match context for the variables to be converted.

# copy()

Return a copy.deepcopy() of self.

Also creates copies the underlying Timeseries data

Returns copy.deepcopy() of self

Return type ScmRun

# data\_hierarchy\_separator = '|'

String used to define different levels in our data hierarchies.

By default we follow pyam and use "|". In such a case, emissions of CO<sub>2</sub> for energy from coal would be "Emissions|CO2|Energy|Coal".

Type str

# delta\_per\_delta\_time(out\_var=None)

Calculate change in timeseries values for each timestep, divided by the size of the timestep

The output is placed on the middle of each timestep and is one timestep shorter than the input.

**Parameters out\_var** (*str*) – If provided, the variable column of the output is set equal to out\_var. Otherwise, the output variables are equal to the input variables, prefixed with "Delta".

**Returns** *scmdata.ScmRun* containing the changes in values of *self*, normalised by the change in time

Return type scmdata.ScmRun

**Warns UserWarning** – The data contains nans. If this happens, the output data will also contain nans.

# divide(other, op\_cols, \*\*kwargs)

Divide values (self / other)

# **Parameters**

- other (ScmRun) ScmRun containing data to divide
- **op\_cols** (*dict of str: str*) Dictionary containing the columns to drop before dividing as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the division will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Quotient of self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

# **Examples**

```
>>> import numpy as np
>>> from scmdata import ScmRun
\rightarrow > IDX = [2010, 2020, 2030]
>>>
>>>
>>> start = ScmRun(
         data=np.arange(18).reshape(3, 6),

drop\_meta(columns: Union[list, str], inplace: Optional[bool] = False)

Drop meta columns out of the Run

# **Parameters**

- **columns** The column or columns to drop
- inplace If True, do operation inplace and return None.

Raises KeyError – If any of the columns do not exist in the meta DataFrame

## property empty: bool

Indicate whether ScmRun is empty i.e. contains no data

Returns If ScmRun is empty, return True, if not return False

Return type bool

**filter**(*keep*: *bool* = *True*, *inplace*: *bool* = *False*, *log\_if\_empty*: *bool* = *True*, \*\*kwargs: Any)
Return a filtered ScmRun (i.e., a subset of the data).

```

   [2 rows x 7 columns]
```

## **Parameters**

- **keep** If True, keep all timeseries satisfying the filters, otherwise drop all the timeseries satisfying the filters
- inplace If True, do operation inplace and return None
- log\_if\_empty If True, log a warning level message if the result is empty.
- \*\*kwargs Argument names are keys with which to filter, values are used to do the filtering. Filtering can be done on:

- all metadata columns with strings, "\*" can be used as a wildcard in search strings
- 'level': the maximum "depth" of IAM variables (number of hierarchy levels, excluding the strings given in the 'variable' argument)
- 'time': takes a datetime.datetime or list of datetime.datetime's TODO: default to np.datetime64
- 'year', 'month', 'day', hour': takes an int or list of int's ('month' and 'day' also accept str or list of str)

If regexp=True is included in kwargs then the pseudo-regexp syntax in pattern\_match() is disabled.

**Returns** If not inplace, return a new instance with the filtered data.

Return type ScmRun

# classmethod from\_nc(fname)

Read a netCDF4 file from disk

**Parameters** fname (str) – Filename to read

#### See also:

```
scmdata.run.ScmRun.from_nc()
```

# get\_meta\_columns\_except(\*not\_group)

Get columns in meta except a set

Parameters not\_group (str or list of str) - Columns to exclude from the grouping

**Returns** Meta columns except the ones supplied (sorted alphabetically)

Return type list

 $get\_unique\_meta(meta: str, no\_duplicates: Optional[bool] = False) \rightarrow Union[List[Any], Any]$  Get unique values in a metadata column.

## **Parameters**

- meta Column to retrieve metadata for
- **no\_duplicates** Should I raise an error if there is more than one unique value in the metadata column?

## Raises

- ValueError There is more than one unique value in the metadata column and no\_duplicates is True.
- **KeyError** If a meta column does not exist in the run's metadata

**Returns** List of unique metadata values. If no\_duplicates is True the metadata value will be returned (rather than a list).

**Return type** [List[Any], Any]

# groupby(\*group)

Group the object by unique metadata

Enables iteration over groups of data. For example, to iterate over each scenario in the object

```
>>> for group in df.groupby("scenario"):
>>>
      print(group)
<scmdata.ScmRun (timeseries: 2, timepoints: 3)>

   2 a_iam a_scenario2 World Primary Energy EJ/yr
                                                             a_model
```

**Parameters group** (str or list of str) – Columns to group by

Returns See the documentation for RunGroupBy for more information

Return type RunGroupBy

```
groupby_all_except(*not_group)
```

Group the object by unique metadata apart from the input columns

In other words, the groups are determined by all columns in self.meta except for those in not\_group

Parameters not\_group (str or list of str) - Columns to exclude from the grouping

**Returns** See the documentation for RunGroupBy for more information

Return type RunGroupBy

```
head(*args, **kwargs)
```

Return head of self.timeseries().

## **Parameters**

- \*args Passed to self.timeseries().head()
- \*\*kwargs Passed to self.timeseries().head()

Returns Tail of self.timeseries()

Return type pandas.DataFrame

# integrate(out\_var=None)

Integrate with respect to time

**Parameters out\_var** (*str*) – If provided, the variable column of the output is set equal to out\_var. Otherwise, the output variables are equal to the input variables, prefixed with "Cumulative".

**Returns** scmdata. ScmRun containing the integral of self with respect to time

Return type scmdata.ScmRun

Warns UserWarning – The data being integrated contains nans. If this happens, the output data will also contain nans.

Interpolate the data onto a new time frame.

## **Parameters**

- target\_times Time grid onto which to interpolate
- **interpolation\_type** (*str*) Interpolation type. Options are 'linear'
- extrapolation\_type (str or None) Extrapolation type. Options are None, 'linear' or 'constant'

**Returns** A new *ScmRun* containing the data interpolated onto the target\_times grid

Return type ScmRun

## line\_plot(\*\*kwargs)

Make a line plot via seaborn's lineplot

Deprecated: use lineplot() instead

**Parameters \*\*kwargs** – Keyword arguments to be passed to seaborn.lineplot. If none are passed, sensible defaults will be used.

Returns Output of call to seaborn.lineplot

Return type matplotlib.axes.\_subplots.AxesSubplot

## linear regression()

Calculate linear regression of each timeseries

**Note:** Times in seconds since 1970-01-01 are used as the x-axis for the regressions. Such values can be accessed with self.time\_points.values.astype("datetime64[s]").astype("int"). This decision does not matter for the gradients, but is important for the intercept values.

**Returns list of dict[str** – List of dictionaries. Each dictionary contains the metadata for the timeseries plus the gradient (with key "gradient") and intercept (with key "intercept"). The gradient and intercept are stored as pint.Quantity.

**Return type** Any]

# linear\_regression\_gradient(unit=None)

Calculate gradients of a linear regression of each timeseries

**Parameters unit** (*str*) – Output unit for gradients. If not supplied, the gradients' units will not be converted to a common unit.

**Returns** self.meta plus a column with the value of the gradient for each timeseries. The "unit" column is updated to show the unit of the gradient.

Return type pandas.DataFrame

## linear\_regression\_intercept(unit=None)

Calculate intercepts of a linear regression of each timeseries

**Note:** Times in seconds since 1970-01-01 are used as the x-axis for the regressions. Such values can be accessed with self.time\_points.values.astype("datetime64[s]").astype("int"). This decision does not matter for the gradients, but is important for the intercept values.

**Parameters unit** (*str*) – Output unit for gradients. If not supplied, the gradients' units will not be converted to a common unit.

**Returns** self.meta plus a column with the value of the gradient for each timeseries. The "unit" column is updated to show the unit of the gradient.

Return type pandas.DataFrame

# linear\_regression\_scmrun()

Re-calculate the timeseries based on a linear regression

**Returns** The timeseries, re-calculated based on a linear regression

Return type scmdata.ScmRun

# lineplot(time\_axis=None, \*\*kwargs)

Make a line plot via seaborn's lineplot

If only a single unit is present, it will be used as the y-axis label. The axis object is returned so this can be changed by the user if desired.

#### **Parameters**

• time\_axis ({None, "year", "year-month", "days since 1970-01-01", "seconds since 1970-01-01"} # noqa: E501) - Time axis to use for the plot.

If None, datetime.datetime objects will be used.

If "year", the year of each time point will be used.

If "year-month", the year plus (month - 0.5) / 12 will be used.

If "days since 1970-01-01", the number of days since 1st Jan 1970 will be used (calculated using the datetime module).

If "seconds since 1970-01-01", the number of seconds since 1st Jan 1970 will be used (calculated using the datetime module).

\*\*kwargs – Keyword arguments to be passed to seaborn.lineplot. If none are passed, sensible defaults will be used.

**Returns** Output of call to seaborn.lineplot

Return type matplotlib.axes.\_subplots.AxesSubplot

# long\_data(time\_axis=None)

Return data in long form, particularly useful for plotting with seaborn

Parameters time\_axis({None, "year", "year-month", "days since 1970-01-01", "seconds since 1970-01-01"}) - Time axis to use for the output's columns.

If None, datetime.datetime objects will be used.

If "year", the year of each time point will be used.

If "year-month", the year plus (month - 0.5) / 12 will be used.

If "days since 1970-01-01", the number of days since 1st Jan 1970 will be used (calculated using the datetime module).

If "seconds since 1970-01-01", the number of seconds since 1st Jan 1970 will be used (calculated using the datetime module).

**Returns** pandas. DataFrame containing the data in 'long form' (i.e. one observation per row).

Return type pandas.DataFrame

```
property meta: pandas.core.frame.DataFrame
Metadata

property meta_attributes
Get a list of all meta keys

Returns Sorted list of meta keys

Return type list

multiply(other, op_cols, **kwargs)
Multiply values
```

# **Parameters**

- **other** (*ScmRun*) *ScmRun* containing data to multiply
- **op\_cols** (*dict of str: str*) Dictionary containing the columns to drop before multiplying as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the multiplication will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Product of self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

# **Examples**

```
>>> import numpy as np
>>> from scmdata import ScmRun
>>>
>>> IDX = [2010, 2020, 2030]
>>>
>>>
>>> start = ScmRun(
        data=np.arange(18).reshape(3, 6),
        index=IDX,
. . .
        columns={
. . .
             "variable": [
. . .
                 "Emissions | CO2 | Fossil",
. . .
                 "Emissions | CO2 | AFOLU",
                 "Emissions | CO2 | Fossil".
. . .
                 "Emissions | CO2 | AFOLU",
                 "Cumulative Emissions | CO2",
. . .
                 "Surface Air Temperature Change",
. . .
             "unit": ["GtC / yr", "GtC / yr", "GtC / yr", "GtC / yr", "GtC", "K
''],
             "region": ["World|NH", "World|NH", "World|SH", "World|SH", "World",
→"World"],
             "model": "idealised",
             "scenario": "idealised".
. . .
```

```

 $plumeplot(ax=None, quantiles\_plumes=[((0.05, 0.95), 0.5), ((0.5,), 1.0)], hue\_var='scenario',$ hue\_label='Scenario', palette=None, style\_var='variable', style\_label='Variable', dashes=None, linewidth=2, time\_axis=None, pre\_calculated=False, quantile\_over=('ensemble\_member',)) Make a plume plot, showing plumes for custom quantiles

## **Parameters**

- ax (matplotlib.axes.\_subplots.AxesSubplot) Axes on which to make the plot
- quantiles\_plumes (list[tuple[tuple, float]]) Configuration to use when plotting quantiles. Each element is a tuple, the first element of which is itself a tuple and the second element of which is the alpha to use for the quantile. If the first element has length two, these two elements are the quantiles to plot and a plume will be made between these two quantiles. If the first element has length one, then a line will be plotted to represent this quantile.
- hue\_var (str) The column of self.meta which should be used to distinguish different hues.
- hue\_label (str) Label to use in the legend for hue\_var.
- palette (dict) Dictionary defining the colour to use for different values of hue\_var.
- **style\_var** (*str*) The column of **self.meta** which should be used to distinguish different styles.
- **style\_label** (*str*) Label to use in the legend for **style\_var**.
- **dashes** (*dict*) Dictionary defining the style to use for different values of style\_var.
- **linewidth** (*float*) Width of lines to use (for quantiles which are not to be shown as plumes)
- time\_axis (str) Time axis to use for the plot (see timeseries())
- **pre\_calculated** (bool) Are the quantiles pre-calculated? If no, the quantiles will be calculated within this function. Pre-calculating the quantiles using ScmRun. quantiles\_over() can lead to faster plotting if multiple plots are to be made with the same quantiles.
- quantile\_over(str, tuple[str])—Columns of self.meta over which the quantiles should be calculated. Only used if pre\_calculated is False.

**Returns** Axes on which the plot was made and the legend items we have made (in case the user wants to move the legend to a different position for example)

Return type matplotlib.axes.\_subplots.AxesSubplot, list

# **Examples**

```
>>> scmrun = ScmRun(
        data=np.random.random((10, 3)).T,
. . .
        columns={
. . .
             "model": ["a_iam"],
. . .
             "climate_model": ["a_model"] * 5 + ["a_model_2"] * 5,
             "scenario": ["a_scenario"] * 5 + ["a_scenario_2"] * 5,
. . .
             "ensemble_member": list(range(5)) + list(range(5)),
             "region": ["World"],
. . .
             "variable": ["Surface Air Temperature Change"],
             "unit": ["K"].
. . .
        },
. . .
        index=[2005, 2010, 2015],
. . .
...)
```

Plot the plumes, calculated over the different ensemble members.

```
>>> scmrun.plumeplot(quantile_over="ensemble_member")
```

Pre-calculate the quantiles, then plot

```
>>> summary_stats = ScmRun(
... scmrun.quantiles_over("ensemble_member", quantiles=quantiles)
... )
>>> summary_stats.plumeplot(pre_calculated=True)
```

**Note:** scmdata is not a plotting library so this function is provided as is, with little testing. In some ways, it is more intended as inspiration for other users than as a robust plotting tool.

**process\_over**(cols: Union[str, List[str]], operation: Union[str, Callable[[pandas.core.frame.DataFrame], Union[pandas.core.frame.DataFrame, pandas.core.series.Series, float]]], na\_override=-1000000.0, op\_cols=None, as\_run=False, \*\*kwargs: Any) → pandas.core.frame.DataFrame Process the data over the input columns.

## **Parameters**

- cols Columns to perform the operation on. The timeseries will be grouped by all other columns in meta.
- **operation** (*str or func*) The operation to perform.

If a string is provided, the equivalent pandas groupby function is used. Note that not all groupby functions are available as some do not make sense for this particular application. Additional information about the arguments for the pandas groupby functions can be found at <a href="https://pandas.pydata.org/pandas-docs/stable/reference/groupby.html">https://pandas.pydata.org/pandas-docs/stable/reference/groupby.html</a>.

If a function is provided, it will be applied to each group. The function must take a dataframe as its first argument and return a DataFrame, Series or scalar.

Note that quantile means the value of the data at a given point in the cumulative distribution of values at each point in the timeseries, for each timeseries once the groupby is applied. As a result, using q=0.5 is the same as taking the median and not the same as taking the mean/average.

• na\_override ([int, float]) - Convert any nan value in the timeseries meta to this value during processing. The meta values converted back to nan's before the run is returned. This should not need to be changed unless the existing metadata clashes with the default na\_override value.

This functionality is disabled if na\_override is None, but may result in incorrect results if the timeseries meta includes any nan's.

• **op\_cols** (*dict of str: str*) – Dictionary containing any columns that should be overridden after processing.

If a required column from scmdata.ScmRun is specified in cols and as\_run=True, an override must be provided for that column in op\_cols otherwise the conversion to scmdata.ScmRun will fail.

• as\_run (bool or subclass of BaseScmRun) — If True, return the resulting timeseries as an scmdata.ScmRun object, otherwise if False, a pandas.DataFrame`or :class:`pandas.Series is returned (depending on the nature of the operation). Some operations may not be able to be converted to a scmdata.ScmRun. For example if the operation returns scalar values rather than timeseries. If a class is provided, the return value will be cast to this class.

• \*\*kwargs — Keyword arguments to pass operation (or the pandas operation if operation is a string)

**Returns** The result of operation, grouped by all columns in *meta* other than cols

Return type pandas.DataFrame or pandas.Series or scmdata.ScmRun

## Raises

• ValueError – If the operation is not an allowed operation

If the value of na\_override clashes with any existing metadata

If operation produces a pandas. Series, but as\_run`is True

If as\_run is not True, False or a subclass of scmdata.run.BaseScmRun

• **scmdata.errors.MissingRequiredColumnError** — If *as\_run* is not False and the result does not have the required metadata to convert to an :class`ScmRun <scmdata.ScmRun>`. This can be resolved by specifying additional metadata via op\_cols

**quantiles\_over**(*cols: Union[str, List[str]], quantiles: Union[str, List[float]], \*\*kwargs: Any*)  $\rightarrow$  pandas.core.frame.DataFrame

Calculate quantiles of the data over the input columns.

#### **Parameters**

- cols Columns to perform the operation on. The timeseries will be grouped by all other columns in meta.
- quantiles The quantiles to calculate. This should be a list of quantiles to calculate (quantile values between 0 and 1). quantiles can also include the strings "median" or "mean" if these values are to be calculated.
- \*\*kwargs Passed to process\_over().

**Returns** The quantiles of the timeseries, grouped by all columns in *meta* other than cols. Each calculated quantile is given a label which is stored in the quantile column within the output index.

Return type pandas.DataFrame

**Raises TypeError** — operation is included in kwargs. The operation is inferred from quantiles.

reduce(func, dim=None, axis=None, \*\*kwargs)

Apply a function along a given axis

This is to provide the GroupBy functionality in ScmRun. groupby() and is not generally called directly.

This implementation is very bare-bones - no reduction along the time time dimension is allowed and only the *dim* parameter is used.

## **Parameters**

- **func** (function) –
- dim (str) Ignored
- **axis** (*int*) The dimension along which the function is applied. The only valid value is 0 which corresponds to the along the time-series dimension.
- **kwargs** Other parameters passed to *func*

## Returns

## Return type ScmRun

#### Raises

- ValueError If a dimension other than None is provided
- NotImplementedError If axis is anything other than 0

```
relative_to_ref_period_mean(append_str=None, **kwargs)
```

Return the timeseries relative to a given reference period mean.

The reference period mean is subtracted from all values in the input timeseries.

## **Parameters**

- append\_str Deprecated
- \*\*kwargs Arguments to pass to filter() to determine the data to be included in the reference time period. See the docs of filter() for valid options.

**Returns** New object containing the timeseries, adjusted to the reference period mean. The reference period year bounds are stored in the meta columns "reference\_period\_start\_year" and "reference\_period\_end\_year".

Return type ScmRun

Raises NotImplementedError - append\_str is not None

```
required_cols = ('model', 'scenario', 'region', 'variable', 'unit')
```

Minimum metadata columns required by an ScmRun.

If an application requires a different set of required metadata, this can be specified by overriding required\_cols on a custom class inheriting scmdata.run.BaseScmRun. Note that at a minimum, ("variable", "unit") columns are required.

```
resample(rule: str = 'AS', **kwargs: Any)
```

Resample the time index of the timeseries data onto a custom grid.

This helper function allows for values to be easily interpolated onto annual or monthly timesteps using the rules='AS' or 'MS' respectively. Internally, the interpolate function performs the regridding.

# **Parameters**

- **rule** See the pandas user guide for a list of options. Note that Business-related offsets such as "BusinessDay" are not supported.
- \*\*kwargs Other arguments to pass through to interpolate()

Returns New ScmRun instance on a new time index

Return type ScmRun

# **Examples**

Resample a run to annual values

```
>>> scm_df = ScmRun(
... pd.Series([1, 2, 10], index=(2000, 2001, 2009)),
... columns={
... "model": ["a_iam"],
... "scenario": ["a_scenario"],
... "region": ["World"],
... "variable": ["Primary Energy"],
```

(continues on next page)

```
"unit": ["EJ/y"],
        }
. . .
...)
>>> scm_df.timeseries().T
model
                   a_iam
scenario
              a_scenario
region
                   World
variable Primary Energy
unit
                    EJ/y
vear
2000
                        1
2010
                      10
```

An annual timeseries can be the created by interpolating to the start of years using the rule 'AS'.

```
>>> res = scm_df.resample('AS')
>>> res.timeseries().T
model
                              a_iam
scenario

                          10.000000
[109 rows x 1 columns]
```

Note that the values do not fall exactly on integer values as not all years are exactly the same length.

#### References

See the pandas documentation for *resample <http://pandas.pydata.org/pandasdocs/stable/reference/api/pandas. Series.resample.html>* for more information about possible arguments.

## property shape: tuple

Get the shape of the underlying data as (num\_timeseries, num\_timesteps)

#### Returns

Return type tuple of int

```
subtract(other, op_cols, **kwargs)
Subtract values
```

## **Parameters**

- other (ScmRun) ScmRun containing data to subtract
- **op\_cols** (*dict of str: str*) Dictionary containing the columns to drop before subtracting as the keys and the value those columns should hold in the output as the values. For example, if we have op\_cols={"variable": "Emissions|CO2 Emissions|CO2|Fossil"} then the subtraction will be performed with an index that uses all columns except the "variable" column and the output will have a "variable" column with the value "Emissions|CO2 Emissions|CO2|Fossil".
- \*\*kwargs (any) Passed to prep\_for\_op()

**Returns** Difference between self and other, using op\_cols to define the columns which should be dropped before the data is aligned and to define the value of these columns in the output.

Return type ScmRun

# **Examples**

```
>>> import numpy as np
>>> from scmdata import ScmRun
>>> IDX = [2010, 2020, 2030]
>>>
>>>
>>> start = ScmRun(
        data=np.arange(18).reshape(3, 6),
        index=IDX,
. . .
        columns={
. . .
            "variable": [
. . .
                 "Emissions | CO2 | Fossil",
. . .
                 "Emissions | CO2 | AFOLU".
. . .
                 "Emissions | CO2 | Fossil",
. . .
                 "Emissions | CO2 | AFOLU".
                 "Cumulative Emissions | CO2",
. . .
                 "Surface Air Temperature Change",

```

tail(\*args: Any, \*\*kwargs: Any) → pandas.core.frame.DataFrame Return tail of self.timeseries().

## **Parameters**

- \*args Passed to self.timeseries().tail()
- \*\*kwargs Passed to self.timeseries().tail()

Returns Tail of self.timeseries()

Return type pandas.DataFrame

time\_mean(rule: str)

Take time mean of self

Note that this method will not copy the metadata attribute to the returned value.

Parameters rule (["AC", "AS", "A"]) – How to take the time mean. The names reflect the pandas user guide where they can, but only the options given above are supported. For clarity, if rule is 'AC', then the mean is an annual mean i.e. each time point in the result is the mean of all values for that particular year. If rule is 'AS', then the mean is an annual mean centred on the beginning of the year i.e. each time point in the result is the mean of all values from July 1st in the previous year to June 30 in the given year. If rule is 'A', then the mean is an

annual mean centred on the end of the year i.e. each time point in the result is the mean of all values from July 1st of the given year to June 30 in the next year.

**Returns** The time mean of self.

Return type ScmRun

## property time\_points

Time points of the data

#### Returns

Return type scmdata.time.TimePoints

**timeseries** (*meta=None*, *check\_duplicated=True*, *time\_axis=None*, *drop\_all\_nan\_times=False*)

Return the data with metadata as a pandas.DataFrame.

#### **Parameters**

- **meta** (*list[str]*) The list of meta columns that will be included in the output's Multi-Index. If None (default), then all metadata will be used.
- **check\_duplicated** (*bool*) If True, an exception is raised if any of the timeseries have duplicated metadata
- time\_axis ({None, "year", "year-month", "days since 1970-01-01", "seconds since 1970-01-01"}) See long\_data() for a description of the options.
- **drop\_all\_nan\_times** (*bool*) Should time points which contain only nan values be dropped? This operation is applied after any transforms introduced by the value of time\_axis.

Returns DataFrame with datetimes as columns and timeseries as rows. Metadata is in the index.

Return type pandas.DataFrame

## Raises

- NonUniqueMetadataError If the metadata are not unique between timeseries and check\_duplicated is True
- NotImplementedError The value of *time\_axis* is not recognised
- **ValueError** The value of *time\_axis* would result in columns which aren't unique

```
to_csv(fname: str, **kwargs: Any) \rightarrow None
```

Write timeseries data to a csv file

**Parameters** fname – Path to write the file into

## to\_iamdataframe() $\rightarrow$ None

Convert to a LongDatetimeIamDataFrame instance.

LongDatetimeIamDataFrame is a subclass of pyam.IamDataFrame. We use LongDatetimeIamDataFrame to ensure all times can be handled, see docstring of LongDatetimeIamDataFrame for details.

**Returns** LongDatetimeIamDataFrame instance containing the same data.

Return type LongDatetimeIamDataFrame

Raises ImportError – If pyam is not installed

to\_nc(fname, dimensions=('region',), extras=(), \*\*kwargs)
Write timeseries to disk as a netCDF4 file

Each unique variable will be written as a variable within the netCDF file. Choosing the dimensions and extras such that there are as few empty (or nan) values as possible will lead to the best compression on disk.

#### **Parameters**

- **fname** (str) Path to write the file into
- **dimensions** (*iterable of str*) Dimensions to include in the netCDF file. The time dimension is always included (if not provided it will be the last dimension). An additional dimension (specifically a co-ordinate in xarray terms), "\_id", will be included if extras is provided and any of the metadata in extras is not uniquely defined by dimensions. "\_id" maps the timeseries in each variable to their relevant metadata.
- extras (iterable of str) Metadata columns to write as variables in the netCDF file (specifically as "non-dimension co-ordinates" in xarray terms, see xarray terminology for more details). Where possible, these non-dimension co-ordinates will use dimension co-ordinates as their own co-ordinates. However, if the metadata in extras is not defined by a single dimension in dimensions, then the extras co-ordinates will have dimensions of "\_id". This "\_id" co-ordinate maps the values in the extras co-ordinates to each timeseries in the serialised dataset. Where "\_id" is required, an extra "\_id" dimension will also be added to dimensions.
- **kwargs** Passed through to xarray.Dataset.to\_netcdf()

#### See also:

```
scmdata.run.ScmRun.to_nc()
to_xarray(dimensions=('region',), extras=(), unify_units=True)
Convert to a xarray.Dataset
```

## **Parameters**

• dimensions (iterable of str) -

# Dimensions for each variable in the returned dataset. If an "\_id" co-ordinate is required (see extras documentation for when "\_id" is required) and is not included in dimensions then it will be the last dimension (or second last dimension if "time" is also not included in dimensions). If "time" is not included in dimensions it will be the last dimension.

- extras (iterable of str) Columns in self.meta from which to create "non-dimension co-ordinates" (see xarray terminology for more details). These non-dimension co-ordinates store extra information and can be mapped to each timeseries found in the data variables of the output xarray.Dataset. Where possible, these non-dimension co-ordinates will use dimension co-ordinates as their own co-ordinates. However, if the metadata in extras is not defined by a single dimension in dimensions, then the extras co-ordinates will have dimensions of "\_id". This "\_id" co-ordinate maps the values in the extras co-ordinates to each timeseries in the serialised dataset. Where "\_id" is required, an extra "\_id" dimension will also be added to dimensions.
- unify\_units (bool) If a given variable has multiple units, should we attempt to unify them?

**Returns** Data in self, re-formatted as an xarray. Dataset

```
Return type xarray.Dataset
```

# Raises

• ValueError – If a variable has multiple units and unify\_units is False.

• **ValueError** – If a variable has multiple units which are not able to be converted to a common unit because they have different base units.

# property values: numpy.ndarray

Timeseries values without metadata

The values are returned such that each row is a different timeseries being a row and each column is a different time (although no time information is included as a plain numpy.ndarray is returned).

**Returns** The array in the same shape as *ScmRun.shape()*, that is (num\_timeseries, num\_timesteps).

Return type np.ndarray

scmdata.run.run\_append(runs, inplace: bool = False, duplicate\_msg: Union[str, bool] = True, metadata:

Optional[Dict[str, Union[str, int, float]]] = None)

Append together many objects.

When appending many objects, it may be more efficient to call this routine once with a list of *ScmRun*'s, than using *ScmRun.append()* multiple times.

If timeseries with duplicate metadata are found, the timeseries are appended and values falling on the same timestep are averaged if duplicate\_msg is not "return". If duplicate\_msg is "return", then the result will contain the duplicated timeseries for further inspection.

```
>>> res = base.append(other, duplicate_msg="return")
<scmdata.ScmRun (timeseries: 5, timepoints: 3)>
Time:
    Start: 2005-01-01T00:00:00

_ 1 _ 0
```

## **Parameters**

- **runs** (list of *ScmRun*) The runs to append. Values will be attempted to be cast to *ScmRun*.
- inplace If True, then the operation updates the first item in runs and returns None.
- duplicate\_msg If True, raise a NonUniqueMetadataError error so the user can see the duplicate timeseries. If False, take the average and do not raise a warning or error. If "warn", raise a warning if duplicate data is detected.
- metadata If not None, override the metadata of the resulting ScmRun with metadata.

Otherwise, the metadata for the runs are merged. In the case where there are duplicate metadata keys, the values from the first run are used.

**Returns** If not inplace, the return value is the object containing the merged data. The resultant class will be determined by the type of the first object.

Return type ScmRun

#### Raises

- TypeError If inplace is True but the first element in dfs is not an instance of ScmRun runs argument is not a list
- ValueError duplicate\_msg option is not recognised.

No runs are provided to be appended

# 1.1.14 scmdata.testing

Testing utilities

 $scmdata.testing.assert\_scmdf\_almost\_equal(left, right, allow\_unordered=False, check\_ts\_names=True, rtol=1e-05, atol=1e-08)$ 

Check that left and right ScmRun are equal.

## **Parameters**

- left (ScmRun) -
- right (ScmRun) -
- allow\_unordered (bool) If true, the order of the timeseries is not checked
- check\_ts\_names (bool) If true, check that the meta names are the same
- **rtol** (*float*) Relative tolerance on numeric comparisons
- atol (float) Absolute tolerance on numeric comparisons

Raises AssertionError - left and right are not equal

## 1.1.15 scmdata.time

Time period handling and interpolation

A large portion of this module was originally from openscm. Thanks to the original author, Sven Willner

# exception scmdata.time.InsufficientDataError

Bases: Exception

Insufficient data is available to interpolate/extrapolate

args

# with\_traceback()

 $Exception.with\_traceback(tb) - set \ self.\_\_traceback\_\_ \ to \ tb \ and \ return \ self.$ 

# class scmdata.time.TimePoints(values)

Bases: object

Handles time points by wrapping numpy.ndarray of numpy.datetime64..

```
as\_cftime(date\_cls = < class 'cftime.\_cftime.DatetimeGregorian' >) \rightarrow list
           Format time points as cftime.datetime
               Parameters date_cls (cftime.datetime) - The time points will be returned as instances of
                   date_cls
               Returns Time points as a list of date_cls objects
               Return type list of cftime.datetime
     days() \rightarrow numpy.ndarray
           Get day of each time point.
               Returns Day of each time point
               Return type numpy.ndarray of int
     hours() \rightarrow numpy.ndarray
           Get hour of each time point.
               Returns Hour of each time point
               Return type numpy.ndarray of int
     months() \rightarrow numpy.ndarray
           Get month of each time point.
               Returns Month of each time point
               Return type numpy.ndarray of int
     to\_index() \rightarrow pandas.core.indexes.base.Index
           Get time points as pandas. Index.
               Returns pandas. Index of numpy. dtype object with name "time" made from the time points
                   represented as datetime.datetime.
               Return type pandas. Index
     property values: numpy.ndarray
           Time points
     weekdays() \rightarrow numpy.ndarray
           Get weekday of each time point.
               Returns Day of the week of each time point
               Return type numpy.ndarray of int
     years() \rightarrow numpy.ndarray
           Get year of each time point.
               Returns Year of each time point
               Return type numpy.ndarray of int
class scmdata.time.TimeseriesConverter(source_time_points: numpy.ndarray, target_time_points:
                                                 numpy.ndarray, interpolation_type='linear',
                                                 extrapolation_type='linear')
     Bases: object
     Interpolator used to convert data between different time bases
```

**Parameters** 

terpolation was removed as it is outside the scope of this package.

1.1. License 67

This is a modified version originally in openscm.time.TimeseriesConverter. The integral preserving in-

- source\_time\_points (np.ndarray) Source timeseries time points
- target\_time\_points (np.ndarray) Target timeseries time points
- interpolation\_type ({"linear"}) Interpolation type. Options are 'linear'
- extrapolation\_type ({"linear", "constant", None}) Extrapolation type. Options are None, 'linear' or 'constant'

Raises InsufficientDataError – Timeseries too short to extrapolate

```
convert_from(values: numpy.ndarray) → numpy.ndarray
```

Convert value **from** source timeseries time points to target timeseries time points.

Parameters values (np.ndarray) - Value

**Returns** Converted data for timeseries values into the target timebase

Return type np.ndarray

```
convert_to(values: numpy.ndarray) → numpy.ndarray
```

Convert value from target timeseries time points to source timeseries time points.

Parameters values (np.ndarray) – Value

**Returns** Converted data for timeseries values into the source timebase

**Return type** np.ndarray

 $points\_are\_compatible(source: numpy.ndarray, target: numpy.ndarray) \rightarrow bool$ 

Are the two sets of time points compatible i.e. can I convert between the two?

## **Parameters**

- **source** Source timeseries time points
- target Target timeseries time points

**Returns** Can I convert between the time points?

Return type bool

# 1.1.16 scmdata.timeseries

TimeSeries handling

Functionality for handling and storing individual time-series

```
class scmdata.timeseries.TimeSeries(data, time=None, **kwargs)
```

Bases: scmdata.\_base.OpsMixin

A 1D time-series with metadata

Proxies an xarray.DataArray with a single time dimension

## copy()

Create a deep copy of the timeseries.

Any further modifications to the Timeseries returned copy will not be reflected in the current Timeseries

## Returns

Return type Timeseries

Interpolate the timeseries onto a new time axis

#### **Parameters**

- target\_times Time grid onto which to interpolate
- interpolation\_type (str) Interpolation type. Options are 'linear'
- **extrapolation\_type** (*str or None*) Extrapolation type. Options are None, 'linear' or 'constant'

**Returns** A new TimeSeries with the new time dimension

Return type TimeSeries

#### property meta

Metadata associated with the timeseries

Returns

Return type dict

#### property name

Timeseries name

If no name was provided this will be an automatically incrementing number

#### reindex(time, \*\*kwargs)

Update the time dimension, filling in the missing values with NaN's

This is different to interpolating to fill in the missing values. Uses *xarray.DataArray.reindex* to perform the reindexing

#### **Parameters**

- time (obj:np.ndarray) Time values to reindex the data to. Should be np.datetime64 values
- \*\*kwargs Additional arguments passed to xarray's DataArray.reindex function

**Returns** A new TimeSeries with the new time dimension

Return type TimeSeries

#### References

 $http://xarray.pydata.org/en/stable/generated/xarray.DataArray.reindex\_like.html \#xarray.DataArray.reindex\_like.html \#xarray.reindex\_like.html \#x$ 

#### property time\_points

Time points of the data

Returns

Return type numpy.ndarray

#### property values

Get the data as a numpy array

**Returns** 

Return type numpy.ndarray

# 1.1.17 scmdata.units

```
Unit handling
class scmdata.units.UnitConverter(source: str, target: str, context: Optional[str] = None)
     Bases: object
     Converts numbers between two units.
     property contexts: Sequence[str]
           Available contexts for unit conversions
     convert_from(v: Union[float, numpy.ndarray]) \rightarrow Union[float, numpy.ndarray]
           Convert value from source unit to target unit.
               Parameters value – Value in source unit
               Returns Value in target unit
               Return type Union[float, np.ndarray]
     convert_{to}(v: Union[float, numpy.ndarray]) \rightarrow Union[float, numpy.ndarray]
           Convert value from target unit to source unit.
               Parameters value - Value in target unit
               Returns Value in source unit
               Return type Union[float, np.ndarray]
     property source: str
          Source unit
     property target: str
          Target unit
     property unit_registry: openscm_units._unit_registry.ScmUnitRegistry
           Underlying unit registry
```

# 1.1.18 Changelog

## master

## v0.13.1

- (#181) Allow the initialisation of empty scmdata. ScmRun objects
- (#180) Add scmdata.processing.calculate\_crossing\_times\_quantiles() to handle quantile calculations with nan values involved
- (#176) Add as\_run argument to scmdata.ScmRun.process\_over() (closes #160)

#### v0.13.0

- (#174) Add scmdata.processing.categorisation\_sr15() (also added functionality for this to scmdata.processing.calculate\_summary\_stats())
- (#173) Add scmdata.processing.calculate\_peak() and scmdata.processing.calculate\_peak\_time() (also added functionality for these to scmdata.processing.calculate\_summary\_stats())
- (#175) Remove unused scmdata.REQUIRED\_COLS (closes #166)
- (#172) Add scmdata.processing.calculate\_summary\_stats()
- (#171) Add scmdata.processing.calculate\_exceedance\_probabilities(), scmdata.processing.calculate\_exceedance\_probabilities\_over\_time() and scmdata.ScmRun.get\_meta\_columns\_except()
- (#170) Added scmdata.ScmRun.groupby\_all\_except() to allow greather use of the concept of grouping by columns except a given set
- (#169) Make scmdata.processing.calculate\_crossing\_times() able to be used as a standalone function rather than being intended to be called via scmdata.ScmRun.process\_over()
- (#168) Improve the error messages when checking that scmdata. ScmRun objects are identical
- (#165) Add scmdata.processing.calculate\_crossing\_times()
- (#164) Added scmdata.ScmRun.append\_timewise() to allow appending of data along the time axis with broadcasting along multiple meta dimensions
- (#164) Sort time axis internally (ensures that scmdata.ScmRun.\_\_repr\_\_() renders properly)
- (#164) Added scmdata.errors.DuplicateTimesError, raised when duplicate times are passed to scmdata. ScmRun
- (#164) Unified capitalisation of error messages in scmdata.errors and added the meta table to exc\_info of NonUniqueMetadataError
- (#163) Added scmdata.ScmRun.adjust\_median\_to\_target() to allow for the median of an ensemble of timeseries to be adjusted to a given value
- (#163) Update scmdata.plotting.RCMIP\_SCENARIO\_COLOURS to new AR6 colours

#### v0.12.1

- (#162) Fix bug which led to a bad read in when the saved data spanned from before year 1000
- (#162) Allowed scmdata.ScmRun.plumeplot() to handle the case where not all data will make complete plumes or have a best-estimate line if pre\_calculated is True. This allows a dataset with one source that has a best-estimate only to be plotted at the same time as a dataset which has a range too with only a single call to scmdata.ScmRun.plumeplot().

#### v0.12.0

• (#161) Loosen requirements and drop Python3.6 support

#### v0.11.0

- (#159) Allow access to more functions in scmdata.run.BaseScmRun.process\_over, including arbitrary functions
- (#158) Return cftime.DatetimeGregorian rather than cftime.datetime from scmdata.time. TimePoints.as\_cftime() and scmdata.offsets.generate\_range() to ensure better interoperability with other libraries (e.g. xarray's plotting functionality). Add date\_cls argument to scmdata.time. TimePoints.as\_cftime() and scmdata.offsets.generate\_range() so that the output date type can be user specified.
- (#148) Refactor scmdata.database.ScmDatabase to be able to use custom backends
- (#157) Add disable\_tqdm parameter to scmdata.database.ScmDatabase.load() and scmdata.database.ScmDatabase.save() to disable displaying progress bars
- (#156) Fix pandas and xarray documentation links
- (#155) Simplify flake8 configuration

#### v0.10.1

• (#154) Refactor common binary operators for scmdata.run.BaseScmRun and scmdata.timeseries. Timeseries into a mixin following the removal of xarray.core.ops.inject\_binary\_ops() in xarray==1.18.0

#### v0.10.0

- (#151) Add ScmRun.to\_xarray() (improves conversion to xarray and ability of user to control dimensions etc. when writing netCDF files)
- (#149) Fix bug in testcase for xarray<=0.16.1
- (#147) Re-do netCDF reading and writing to make use of xarray and provide better handling of extras (results in speedups of 10-100x)
- (#146) Update CI-CD workflow to include more sensible dependencies and also test Python3.9
- (#145) Allow ScmDatabase.load() to handle lists as filter values

#### v0.9.1

• (#144) Fix ScmRun.plumeplot() style handling (previously, if dashes was not supplied each line would be a different style even if all the lines had the same value for style\_var)

#### v0.9.0

• (#143) Alter time axis when serialising to netCDF so that time axis is easily read by other tools (e.g. xarray)

#### v0.8.0

- (#139) Update filter to handle metadata columns which contain a mix of data types
- (#139) Add ScmRun.plumeplot()
- (#140) Add workaround for installing scmdata with Python 3.6 on windows to handle lack of cftime 1.3.1 wheel
- (#138) Add ScmRun.quantiles\_over()
- (#137) Fix scmdata.ScmRun.to\_csv() so that writing and reading is circular (i.e. you end up where you started if you write a file and then read it straight back into a new scmdata.ScmRun instance)

#### v0.7.6

- (#136) Make filtering by year able to handle a np.ndarray of integers (previously this would raise a TypeError)
- (#135) Make scipy lazy loading in scmdata.time follow lazy loading seen in other modules
- (#134) Add CI run in which seaborn is not installed to check scipy importing

#### v0.7.5

• (#133) Pin pandas<1.2 to avoid pint-pandas installation failure (see pint-pandas #51)

#### v0.7.4

- (#132) Update to new openscm-units 0.2
- (#130) Add stack info to warning message when filtering results in an empty scmdata.run.ScmRun

# v0.7.3

- (#124) Add scmdata.run.BaseScmRun and scmdata.run.BaseScmRun.required\_cols so new subclasses can be defined which use a different set of required columns from scmdata.run.ScmRun. Also added scmdata.errors.MissingRequiredColumn and tidied up the docs.
- (#75) Add test to ensure that scmdata.ScmRun.groupby() cannot pick up the same timeseries twice even if metadata is changed by the function being applied
- (#125) Fix edge-case when filtering an empty scmdata. ScmRun
- (#123) Add scmdata.database.ScmDatabase to read/write data using multiple files. (closes #103)

#### v0.7.2

- (#121) Faster implementation of scmdata.run.run\_append(). The original timeseries indexes and order are no longer maintained after an append.
- (#120) Check the type and length of the runs argument in scmdata.run.run\_append() (closes #101)

#### v0.7.1

- (#119) Make groupby support grouping by metadata with integer values
- (#119) Ensure using scmdata.run.run\_append() does not mangle the index to pd.DatetimeIndex

#### v0.7.0

- (#118) Make scipy an optional dependency
- (#117) Sort timeseries index ordering (closes #97)
- (#116) Update scmdata.ScmRun.drop\_meta() inplace behaviour
- (#115) Add *na\_override* argument to scmdata.ScmRun.process\_over() for handling nan metadata (closes #113)
- (#114) Add operations: scmdata.ScmRun.linear\_regression(), scmdata.ScmRun.linear\_regression\_intercept() and scmdata.ScmRun.linear\_regression\_intercept() and scmdata.ScmRun.linear\_regression\_scmrun()
- (#111) Add operation: scmdata.ScmRun.delta\_per\_delta\_time()
- (#112) Ensure unit conversion doesn't fall over when the target unit is in the input
- (#110) Revert to using pd.DataFrame with pd.Categorical series as meta indexes.
- (#108) Remove deprecated ScmDataFrame (closes #60)
- (#105) Add performance benchmarks for ScmRun
- (#106) Add ScmRun.integrate() so we can integrate timeseries with respect to time
- (#104) Fix bug when reading csv/excel files which use integer years and lowercase\_cols=True (closes #102)

# v0.6.4

- (#96) Fix non-unique timeseries metadata checks for ScmRun.timeseries()
- (#100) When initialising ScmRun from file, make the default be to read with pd.read\_csv(). This means we now initialising reading from gzipped CSV files.
- (#99) Hotfix failing notebook test
- (#94) Fix edge-case issue with drop\_meta (closes #92)
- (#95) Add drop\_all\_nan\_times keyword argument to ScmRun.timeseries() so time points with no data of interest can easily be removed

#### v0.6.3

• (#91) Provide support for pandas==1.1

#### v0.6.2

- (#87) Upgrade workflow to use isort>=5
- (#82) Add support for adding Pint scalars and vectors to scmdata. Timeseries and scmdata. ScmRun instances
- (#85) Allow required columns to be read as extras from netCDF files (closes #83)
- (#84) Raise a DeprecationWarning if no default inplace argument is provided for ScmRun.drop\_meta(). inplace default behaviour scheduled to be changed to False in v0.7.0
- (#81) Add scmdata.run.ScmRun.metadata to track ScmRun instance-specific metadata (closes #77)
- (#80) No longer use pandas.tseries.offsets.BusinessMixin to determine Business-related offsets in scmdata.offsets.to\_offset(). (closes #78)
- (#79) Introduce scmdata.errors.NonUniqueMetadataError. Update handling of duplicate metadata so default behaviour of run\_append is to raise a NonUniqueMetadataError. (closes #76)

#### v0.6.1

- (#74) Update handling of unit conversion context during unit conversions
- (#73) Only reindex timeseries when dealing with different time points

#### v0.5.2

- (#65) Use pint for ops, making them automatically unit aware
- (#71) Start adding arithmetic support via scmdata.ops. So far only add and subtract are supported.
- (#70) Automatically set y-axis label to units if it makes sense in ScmRun's lineplot() method

### v0.5.1

- (#68) Rename scmdata.run.df\_append() to :func`scmdata.run.run\_append`. :func`scmdata.run.df\_append` deprecated and will be removed in v0.6.0
- (#67) Update the documentation for ScmRun.append()
- (#66) Raise ValueError if index/columns arguments are not provided when instantiating a :class`ScmRun` object with a numpy array. Add lowercase\_cols argument to coerce the column names in CSV files to lowercase

#### v0.5.0

- (#64) Remove spurious warning from ScmRun's filter() method
- (#63) Remove set\_meta() from ScmRun in preference for using the \_\_setitem\_\_() method
- (#62) Fix interpolation when the data contains nan values
- (#61) Hotfix filters to also include caret ("^") in pseudo-regexp syntax. Also adds empty() property to ScmRun
- (#59) Deprecate ScmDataFrame. To be removed in v0.6.0
- (#58) Use cftime datetimes when appending ScmRun objects to avoid OutOfBounds errors when datetimes span
  many centuries
- (#55) Add time\_axis keyword argument to ScmRun.timeseries, ScmRun.long\_data and ScmRun. lineplot to give greater control of the time axis when retrieving data
- (#54) Add drop\_meta() to ScmRun for dropping metadata columns
- (#53) Don't convert case of variable names written to file. No longer convert case of serialized dataframes
- (#51) Refactor relative\_to\_ref\_period\_mean() so that it returns an instance of the input data type (rather than a pd.DataFrame) and puts the reference period in separate meta columns rather than mangling the variable name.
- (#47) Update README and setup.py to make it easier for new users

#### v0.4.3

• (#46) Add test of conda installation

### v0.4.2

• (#45) Make installing seaborn optional

#### v0.4.1

- (#44) Add multi-dimensional handling to scmdata.netcdf
- (#43) Fix minor bugs in netCDF handling and address minor code coverage issues
- (#41) Update documentation of the data model. Additionally:
  - makes .time\_points attributes consistently return scmdata.time.TimePoints instances
  - ensures .meta is used consistently throughout the code base (removing .metadata)
- (#33) Remove dependency on pyam. Plotting is done with seaborn instead.
- (#34) Allow the serialization/deserialization of scmdata.run.ScmRun and scmdata.ScmDataFrame as netCDF4 files.
- (#30) Swap to using opensem-units for unit handling (hence remove much of the scmdata.units module)
- (#21) Added scmdata.run.ScmRun as a proposed replacement for scmdata.dataframe.ScmDataFrame. This new class provides an identical interface as a ScmDataFrame, but uses a different underlying data structure to the ScmDataFrame. The purpose of ScmRun is to provide performance improvements when handling large sets of time-series data. Removed support for Python 3.5 until pyam dependency is optional
- (#31) Tidy up repository after changing location

# v0.4.0

• (#28) Expose scmdata.units.unit\_registry

#### v0.3.1

- (#25) Make scipy an optional dependency
- (#24) Fix missing "N2O" unit (see #14). Also updates test of year to day conversion, it is 365.25 to within 0.01% (but depends on the Pint release).

# v0.3.0

- (#20) Add support for python=3.5
- (#19) Add support for python=3.6

#### v0.2.2

• (#16) Only rename columns when initialising data if needed

#### v0.2.1

- (#13) Ensure LICENSE is included in package
- (#11) Add SO2F2 unit and update to Pyam v0.3.0
- (#12) Add get\_unique\_meta convenience method
- (#10) Fix extrapolation bug which prevented any extrapolation from occuring

# v0.2.0

- (#9) Add time\_mean method
- (#8) Add make docs target

#### v0.1.2

- (#7) Add notebook tests
- (#4) Unit conversions for CH4 and N2O contexts now work for compound units (e.g. 'Mt CH4 / yr' to 'Gt C / day')
- (#6) Add auto-formatting

# v0.1.1

• (#5) Add scmdata.dataframe.df\_append to \_\_init\_\_.py

# v0.1.0

- (#3) Added documentation for the api and Makefile targets for releasing
- (#2) Refactored scmdataframe from openclimatedata/openscm@077f9b5 into a standalone package
- (#1) Add docs folder
